Task 72-00-35-050-001-A:

1. Remove Fuel/Oil Cooler - For Engines Not Equipped With Front Split Mount Bracket (Pre SB PW4ENG 79-20)

   A. Equipment And Materials Necessary - None

   B. Procedure
   See Figure 301, Figure 302, Figure 303, Figure 304, and Figure 305.

      (1) Disconnect harnesses from fuel/oil cooler as follows. See Figure 301.

         (a) Disconnect W3P5 and W5P5 harness connectors from oil cooler bypass valve solenoid.

         (b) Remove bolts and nuts securing W3 and W5 harness to brackets at front of cooler and bracket below cooler.

         (c) Install protective closures to connectors.

         (d) Remove four bolts securing loop clamp brackets to fuel/oil cooler. Remove brackets and reinstall bolts handtight.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

      (2) Disconnect tubes from fuel/oil cooler and fuel/oil cooler bypass valve as follows. See Figure 302.

         NOTE: Be prepared to catch fuel and oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

         (a) Loosen and remove all clamp bolts and nuts securing the following tubes to HPC case brackets and to each other.

1 Oil cooler inlet fuel tubes (FM10) and (FM12)

2 Oil cooler inlet oil tube (airframe) (LS05).

3 Air cooler outlet oil hose and tube assembly (LP03).

(b) Remove lockwire and disconnect oil cooler inlet return manifold (CR04) from front of fuel/oil cooler.

(c) Remove six bolts securing two oil cooler inlet fuel tubes to fuel pump and fuel bypass valve (FM10) and (FM12). Remove lockwire and disconnect same tubes from fuel/oil cooler. Disengage tubes at both ends. Remove and discard packings and retainers.

(d) Remove lockwire and disconnect left oil cooler inlet oil tube (airframe) (LS05) from right tube at union at approximately 6 o'clock position. Remove lockwire and disconnect tube from fuel/oil cooler bypass valve. Disengage tube. Remove packings and retainer and discard.

(e) Remove lockwire and disconnect air cooler outlet oil hose and tube assembly (LP03) from fuel/oil cooler bypass valve. Disengage hose and tube assembly from fuel/oil cooler bypass valve.

(f) Remove lockwire and disconnect oil cooler bypass valve drain tube (LP20) from fuel/oil cooler bypass valve.

(g) Remove lockwire and disconnect oil cooler outlet fuel tube (FM11) from rear of fuel/oil cooler.

(3) Remove main bearing strainer housing as follows. See Figure 303.

NOTE: Be prepared to catch fuel and oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) (Post SB PW4ENG 79-52), Remove the bolt, nut and clamp that attach the tube (LP32) to a bracket on the flange of the secondary flow control valve.

(b) Remove the lockwire. Use the wrenching flats to disconnect the tube nuts from the oil tube metering nipple. Loosen the clamp bolts that attach the oil trim pressure tube (LP32). Loosen the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing. Remove the metering nipple.

(c) (Pre SB PW4ENG 79-52), Remove the lockwire and disconnect the No. 3 bearing oil pressure manifold (LP18) from the rear of the main bearing strainer housing. Remove the hose clamp, spray shield, and lockwire. Disconnect the manifold from the front of the No. 3 bearing oil strainer housing (LP19). Remove the attaching hardware. Remove the tube.

(d) (Post SB PW4ENG 79-52), Remove the lockwire and disconnect the No. 3 bearing oil pressure manifold (LP18) from the rear of the main bearing strainer housing. Remove the bolt, clamp and spray shield from the rear of the manifold. Disconnect the manifold from the front of the No. 3 bearing pressure tube (LP19). Remove the attaching hardware and remove the tube from the engine.

(e) Remove lockwire and disconnect gearbox oil pressure manifold (LP08) from inboard side of strainer housing.

(f) Disconnect the No. 1, 1.5 and 2 main bearing oil pressure tube (LP05) as follows. See Figure 303.

1 Remove the lockwire and disengage the tube nuts from the front side of the main bearing strainer element housing and from the strainer housing attached to the bracket on Flange E.

2 Loosen the clamp bolt that attaches the tube to the bracket on Flange E.

3 (Post SB PW4ENG 79-33), Remove the bolt and nut that attach the main bearing oil pressure tube (LP05) to a bracket on the main bearing breather tube (LB06). Clamp can stay with tube.

4 Disengage the tube from the strainer housings.

(g) Remove four bolts securing strainer housing to top of fuel/oil cooler. Reposition brackets on strainer housing flange with W5 harness attached and remove strainer housing.

(h) Remove packings from tubes and packing on strainer housing flange and discard.

(i) Install protective closures.

(4) Remove fuel/oil cooler as follows. See Figure 304.

(a) Remove four bolts and three washers securing rear of oil cooler to HPC case bracket. Position loop clamp bracket rearward.

WARNING: TAKE NECESSARY PRECAUTIONS TO AVOID EXCESSIVE CONTACT WITH FUEL AND OIL DRAINAGE DURING REMOVAL OF COOLER.

(b) Raise rear of cooler off tube connections and move rearward to disengage front mount pin. Reposition W3 and W5 harness forward of cooler. Remove cooler from engine forward end first.

(c) Remove all packings and retainers from tubes and discard.

(d) Install protective closures.

(5) If fuel/oil cooler is to be replaced, comply with the following. See Figure 305.

(a) Remove tube adapters and plugs from fuel/oil cooler. Discard packings.

(b) Remove cotter pin, nut, and pin, from fuel/oil cooler front ear.

R
R

(c) Remove fuel/oil cooler bypass valve and adapters if necessary. See Removal−11 (Task 72−00−35−050−008).

(d) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Fuel/Oil Heat Exchanger Component Maintenance Manual, 79−21−15, (Serck Heat Transfer).

Task 72−00−35−050−001−B:

2. Remove Fuel/Oil Cooler − For Engines Equipped With Front Split Mount Bracket (Post SB PW4ENG 79−20)

A. Equipment And Materials Necessary − None

B. Procedure
See Figure 306, Figure 307, Figure 308, Figure 309 and Figure 310.

(1) Disconnect harnesses from fuel/oil cooler as follows. See Figure 306.

(a) Disconnect W3P5 and W5P5 harness connectors from oil cooler bypass valve solenoid.

(b) Remove bolts and nuts securing W3 and W5 harness to brackets at front of cooler and bracket below cooler.

(c) Install protective closures to connectors.

(d) Remove four bolts securing loop clamp brackets to fuel/oil cooler. Remove brackets and reinstall bolts handtight.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE

R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(2) Disconnect tubes from fuel/oil cooler and fuel/oil cooler bypass valve as follows. See Figure 307.

NOTE: Be prepared to catch fuel and oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

(a) Remove lockwire and disconnect oil cooler inlet return manifold (CR04) from front of fuel/oil cooler.

(b) Remove lockwire and disconnect two oil cooler inlet fuel tubes (FM10) and (FM12) from bottom of fuel/oil cooler.

(c) Remove lockwire and disconnect oil cooler inlet oil tube (LS05) (airframe) from fuel/oil cooler bypass valve.

(d) Remove lockwire and disconnect air cooler outlet oil hose and tube assembly (LP03) from fuel/oil cooler bypass valve.

(e) Remove lockwire and disconnect oil cooler bypass valve drain tube (LP20) from fuel/oil cooler bypass valve.

(f) Remove lockwire and disconnect oil cooler outlet fuel tube (FM11) from rear of fuel/oil cooler.

(3) Remove main bearing strainer housing as follows. See Figure 308.

NOTE: Be prepared to catch fuel and oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) (Post SB PW4ENG 79−52), Remove the bolt, nut and clamp that attach the tube (LP32) to a bracket on the flange of the secondary flow control valve.

(b) Remove the lockwire. Use the wrenching flats to disconnect the tube nuts from the oil tube metering nipple. Loosen the clamp bolts that attach the oil trim pressure tube (LP32). Loosen the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing. Remove the metering nipple.

(c) (Pre SB PW4ENG 79−52), Remove the lockwire and disconnect the No. 3 bearing oil pressure manifold (LP18) from the rear of the main bearing strainer housing. Remove the hose clamp, spray shield, and lockwire. Disconnect the manifold from the front of the No. 3 bearing oil strainer housing (LP19). Remove the attaching hardware. Remove the tube.

(d) (Post SB PW4ENG 79−52), Remove the lockwire and disconnect the No. 3 bearing oil pressure manifold (LP18) from the rear of the main bearing strainer housing. Remove the bolt, clamp and spray shield from the rear of the manifold. Disconnect the manifold from the front of the No. 3 bearing pressure tube (LP19). Remove the attaching hardware and remove the tube from the engine.

(e) Remove lockwire and disconnect gearbox oil pressure manifold (LP08) from inboard side of strainer housing.

(f) Disconnect the No. 1, 1.5 and 2 main bearing oil pressure tube (LP05) as follows. See Figure 303.

1 Remove the lockwire and disengage the tube nuts from the front side of the main bearing strainer element housing and from the strainer housing attached to the bracket on Flange E.

2 Loosen the clamp bolt that attaches the tube to the bracket on Flange E.

3 (Post SB PW4ENG 79−33), Remove the bolt and nut that attach the main bearing oil pressure tube (LP05) to a bracket on the main bearing breather tube (LB06). Clamp can stay with tube.

4 Disengage the tube from the strainer housings.

(g) Remove four bolts securing strainer housing to top of fuel/oil cooler. Reposition brackets on strainer housing flange with W5 harness attached and remove strainer housing.

(h) Remove packings from tubes and strainer housing flange and discard.

(i) Install protective closures.

(4) Remove fuel/oil cooler as follows. See Figure 309.

(a) Remove two bolts securing front oil cooler bracket to HPC case bracket.

(b) Remove four bolts and three washers securing rear of oil cooler to HPC case bracket. Reposition loop clamp bracket rearward.

WARNING: TAKE NECESSARY PRECAUTIONS TO AVOID EXCESSIVE CONTACT WITH FUEL AND OIL DRAINAGE DURING REMOVAL OF COOLER.

(c) Raise cooler off tube connections and move outward and rearward. Reposition W3 and W5 harness forward of cooler. Remove cooler from engine forward end first.

(d) Remove front oil cooler bracket from pin on cooler.

(e) Remove all packings and retainers from tubes and discard.

(f) Install protective closures.

(5) If fuel/oil cooler is to be replaced, comply with the following. See Figure 310.

(a) Remove tube adapters and plugs from fuel/oil cooler. Discard packings.

(b) Remove cotter pin, nut, pin, and oil cooler bracket retainer from fuel/oil cooler front ear.

(c) Remove fuel/oil cooler bypass valve and adapters if necessary. See Removal−11 (Task 72−00−35−050−008).

(d) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Fuel/Oil Heat Exchanger Component Maintenance Manual, 79−21−15, (Serck Heat Transfer).

Task 72−00−35−050−002:

1. Remove Turbine Case Cooling (TCC) Air Valve Actuator

A. Equipment And Materials Necessary − None

B. Procedure
See Figure 301.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Disconnect W4P16 harness connector from connector on actuator. Install protective closures.

(2) Remove nut and bolt securing cable rod end bearing to valve idler arm at turbine case cooling (TCC) air shutoff valve (HPT).

(3) Remove lockwire from cable coupling nut, and disconnect cable coupling nut from actuator.

(4) Remove lockwire and disconnect the pressure and return hoses at forward lower side of actuator.

NOTE: Be prepared to catch fuel in a container with a minimum capacity of 1 U.S. gallon (3.8 liters).

(5) Remove bolt securing ground strap to rear of actuator.

(6) Remove bolts (and nuts if equipped) securing the four hinged clamps on actuator mount rails to bracket on HPC case.

(7) Lift actuator clear of bracket pins and stop. Release cable end from actuator piston shaft and remove actuator from engine.

(8) Install protective closures.

(9) If actuator is to be replaced, comply with the following.

  (a) Remove plug from lower rear port of actuator. Remove packing and discard.

  (b) Remove lockwire and four clamps.

  (c) Install protective closure.

    NOTE: For additional information concerning detailed maintenance of the component, see Turbine Case Cooling (TCC) Air Valve Actuator Component Maintenance Manual, 75−24−14 (Parker Hannifin).

ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−06

Task 72−00−35−050−003:

1. Remove Turbine Vane And Blade Cooling Air Valve Position Switch

   A. Equipment And Materials Required − None

   B. Procedure
   See Figure 301.

      NOTE: This procedure is applicable for engines without SB PW4ENG 72−572 or SB PW4ENG 75−106 only or SB PW4ENG 75−756 or SB PW4ENG 75−759 or SB PW4ENG 75−147 only.

      (1) Disconnect W4P21 harness connector from turbine vane and blade cooling air valve position switch on turbine vane cooling air valve on right side of engine on HPC case at approximately the 3 o'clock position. Install protective closures.

      (2) Remove bolts securing position switch to outer surface of turbine vane and blade cooling air valve and remove position switch from engine.

         NOTE: For additional information concerning detailed maintenance of this component see Turbine Vane And Blade Cooling Air Valve Position Switch Component Maintenance Manual 75−24−11, (Midland Ross).

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-07

Task 72-00-35-050-005:

1. Remove Turbine Vane And Blade Cooling Air Valve (Right)

A. Prerequisite

(1) Remove turbine vane and blade cooling air valve position switch per 72-00-35, Removal-06.

B. Equipment And Materials Necessary - None

C. Procedure
See Figure 301 and Figure 302.

(1) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75-116) Remove lockwire and disconnect air signal tube (AA21) from valve.

(2) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75-116) Remove lockwire and disconnect air signal tube (AA90) from valve.

(3) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove the lockwire and disconnect the air signal tube (AA77) from the valve.

(4) Loosen and remove bolts securing rear flange of valve to forward flange of turbine vane cooling air tube assembly (AP02).

(5) Remove bolts that attach the bracket and the turbine blade cooling air tube assembly (AP37) front flange to the valve.

(a) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72-572 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove and discard the gaskets. Remove the metering plate and install the protective closures.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Post PW4ENG 72-572 and Pre SB PW4ENG 72-627 or Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove and discard the gaskets. Remove the ring spacer and install the protective closures.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Pre SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Remove and discard the gaskets. Remove the metering plate and install the protective closures.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Remove and discard the gaskets. Remove the ring spacer and install the protective closures.

(e) If valve is to be replaced, remove tube adapter and copper gasket from valve. Discard gasket.

(6) Remove the bolt and nut that attaches the air signal tube to the bracket mounted to the valve flange.

(7) Remove the bolt and nut that attaches the adjustable link to same the bracket.

(8) Remove the bolts that attaches the valve flange and the bracket to the HPC case.

NOTE: The use of a standard 5/16 inch, 12 point torque adapter, with a length of approximately 2 9/16 inch (65.088 mm), will make the valve removal easier.

(9) Remove the turbine vane and blade cooling air valve (right) from the engine. Discard the gasket.

(10) Install protective closures to open tubes and valve pad.

NOTE: For additional information concerning detailed maintenance of this component see Turbine Vane And Blade Cooling Air Valve Component Maintenance Manual, 75−24−12 (Midland Ross).

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-08

Task 72-00-35-050-004:

1. Remove Turbine Vane And Blade Cooling Air Valve (Left)
    A. Equipment And Materials Required - None
    B. Procedure
    See Figures 301 and 302.
        (1) Remove lockwire and disconnect air signal tube (AA19) from valve.
        (2) Loosen and remove bolts securing rear flange of valve to forward flange of turbine vane cooling air tube assembly (AP04).
        (3) Remove bolts securing turbine blade cooling air tube assembly (AP38) front flange to valve.
            (a) FOR THESE MODELS: 4152, 4156A, 4158 (Pre SB PW4ENG 72-572 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove and discard the gaskets. Remove the metering plate and install the protective closures.
            (b) FOR THESE MODELS: 4152, 4156A, 4158 (Post PW4ENG 72-572 and Pre SB PW4ENG 72-627 or Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove and discard the gaskets. Remove the ring spacer and install the protective closures.
            (c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 (Pre SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove and discard the gaskets. Remove the metering plate and install the protective closures.
            (d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove and discard the gaskets. Remove the ring spacer and install the protective closures.
        (4) Remove bolt and nut securing tube clamp to bracket attached to valve flange.
        (5) Remove bolts securing valve flange to engine pad.

NOTE: The use of a standard 5/16 inch, 12 point torque adapter, with a length of approximately 2 9/16 inch (65.088 mm), will make the valve removal easier.

        (6) Remove bracket and turbine vane and blade cooling air valve (left) from engine. Discard metal gasket. Install protective closures to open tubes and valve pad.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-09

Task 72-00-35-050-006:

1. Remove HPC Secondary Flow Control Valve (Left)

   A. Equipment And Materials Required - None

   B. Procedure

   See Figure 301.

   NOTE: This procedure is applicable for engines without SB PW4ENG 72-572 or SB PW4ENG 75-106 only.

   (1) Remove lockwire and disconnect W5P10 harness connector from valve. Install protective closures.

   (2) (Post SB PW4ENG 75-85), Remove the lockwire and disconnect the signal tube (AA16) from the adapter.

   (3) Remove the clamp bolt and nut that attach the tube to the bracket on the rear of the valve (Post SB PW4ENG 72-211).

   (4) Remove six bolts securing valve to HPC case. Remove valve from case. Discard gasket. Install protective closures.

   (5) If valve is to be replaced, comply with the following:

   (a) (Pre SB PW4ENG 75-85), Remove lockwire from the cap assembly and the cap assembly from adapter.

   (b) Remove the adapter and the gasket from the valve. Install protection covers.

   NOTE: HPC air valve signal tube was removed and cap assemblies installed on the air filter and the HPC air valve by Alert Service Bulletin (PW4ENG 75-62R2).

   HPC air valve signal tube was re-installed and the cap assemblies were removed from the air filter and the HPC air valve by Service Bulletin (PW4ENG 75-85).

   (c) Remove six bolts securing two covers and bracket (Post SB PW4ENG 72-211 only) to valve. Remove covers and install protective closures.

(d) Remove lockwire and remove remaining plug and gasket from valve. Install protective closure.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Rotor Heating Air Valve Component Maintenance Manual, 75−33−08 (Midland Ross).

Task 72-00-35-050-007:

R 1. (Pre SB PW4ENG 72-756) Remove HPC Secondary Flow Control Valve (Right)

A. Equipment And Materials Necessary - None

B. Procedure
See Figure 301.

NOTE: This procedure is applicable for engine without SB PW4ENG 75-106 or SB PW4ENG 72-572 only.

(1) Remove lockwire and disconnect W4P10 harness connector from valve. Install protective closures.

(2) (Post SB PW4ENG 75-85 and Pre SB PW4ENG 75-116) Remove the lockwire and disconnect the signal tube (AA15) from the adapter.

(3) (Post SB PW4ENG 75-116) Remove the lockwire and disconnect the signal tube (AA91) from the adapter.

(4) Remove six bolts securing valve and bracket (Post SB PW4ENG 73-163) to HPC case. Remove valve from case. Discard gasket. Install protective closure on HPC case pad on valve mounting flange.

(5) If valve is to replaced, comply with the following:

(a) (Pre SB PW4ENG 75-85), Remove lockwire from the cap assembly and the cap assembly from adapter.

NOTE: The HPC air valve signal tube was removed and cap assemblies were installed on the air filter and the HPC air valve by Alert SB PW4ENG 75-62R2.

NOTE: The HPC air valve signal tube was reinstalled and the cap assemblies were removed from the air filter and the HPC air valve by SB PW4ENG 75-85.

(b) Remove the adapter and the gasket from the valve. Install protection covers.

(c) Remove six bolts securing two covers to valve. Remove covers and install protective closures.

ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−10

(d) Remove lockwire and remove remaining plug and gasket from valve. Install protective closure.

NOTE: For additional information concerning detailed maintenance of this component, see Compressor Rotor Heating Air Valve Component Maintenance Manual, 75−33−08 (Midland Ross).

Task 72-00-35-050-008:

1. Remove Fuel/Oil Cooler Bypass Valve
   - A. Prerequisites
     - (1) Remove fuel/oil cooler. See Removal-04 (Task 72-00-35-050-001).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figure 301.
     - (1) Remove eight bolts (301/9) and washers (301/8) securing bypass valve (301/2) to fuel/oil cooler (301/1) and remove valve. Discard gasket (301/7).
     - (2) Install protective closures.
     - (3) If bypass valve is to be replaced comply with the following.
       - (a) Remove lockwire, plug, adapters, and packings from bypass valve. Discard packings. Install protective closures.

         NOTE: For additional information concerning detailed maintenance of this component see Fuel/Oil Heat Exchanger Bypass Valve Component Maintenance Manual 79-21-16, (Parker Hannifin).

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-12

Task 72-00-35-050-009:

1. Remove 9th Stage Start/Stability (2.9) Bleed Valve (Upper Left)
   A. Prerequisites
      (1) For engines with the 2.9 bleed valve thermocouple probe, remove the probe. See 72-00-35, Removal-17 (Task 72-00-35-050-014).
   B. Equipment And Materials Required

      Special Tools:
      PWA 85436 Adapter, Torque

   C. Procedure
      See Figure 301.
      (1) Remove lockwire and disconnect manifold tube nut (AA30) (301/6) from 2.9 bleed valve (301/5), located at 10 o'clock position on left side of HPC case.
      (2) Using PWA 85436 Torque Adapter, remove eight bolts (301/4) securing bleed valve (301/5) to engine, and remove valve.
      (3) Remove gasket (301/3) from boss and discard. Install protective closures.
      (4) Remove adapter (301/1) from bleed valve (301/5) and discard gasket, (301/2). Install protective closures on bleed valve.
      (5) If equipped remove the bolts (301/7) and the cover (301/8) from the boss located on the side of the bleed valve. Install a protection cover on the bleed valve.

      NOTE: For additional information concerning detailed maintenance of this component see 9th Stage Start Bleed Valve Component Maintenance Manual, 75-31-40 (Midland Ross).

Task 72-00-35-050-010:

1. Remove 9th Stage Start/Stability (2.9) Bleed Valve (Upper Right)
    - A. Prerequisites
        - (1) For engines with the 2.9 bleed valve thermocouple probe, remove the probe. See 72-00-35, Removal-17 (Task 72-00-35-050-014).
    - B. Equipment And Materials Required

      Special Tools:
      PWA 85436 Adapter, Torque

    - C. Procedure
      See Figure 301.
        - (1) Remove lockwire and disconnect manifold tube nut (AA28) (301/7) from 2.9 bleed valve (301/1), located at 1 o'clock position on right side of HPC case.
        - (2) Using PWA 85436 Torque Adapter, remove eight bolts (301/2) and bracket (301/3), securing bleed valve (301/1) to engine and remove valve.
        - (3) Remove gasket (301/4) from boss and discard. Install protective closures.
        - (4) Remove adapter (301/6) from bleed valve (301/1) and discard gasket, (301/5). Install protective closures on bleed valve.
        - (5) If equipped remove the bolts (301/9) and the cover (301/8) from the boss located on the side of the bleed valve. Install a protection cover on the bleed valve.

          NOTE: For additional information concerning detailed maintenance of this component see 9th Stage Start Bleed Valve Component Maintenance Manual, 75-31-40 (Midland Ross).

Task 72-00-35-050-012:

1. Remove Variable Stator Vane Actuator
   A. Equipment And Materials Required

      Special Tools:
      PWA 85688 Puller, Jackscrew

   B. Procedure
      See Figure 301.
      (1) Disconnect W4P3 and W5P7 harness connectors (301/10) from stator vane actuator (301/18). Install protective closures.
      (2) Disconnect ground cable (301/11) attached to actuator (301/18).
      (3) Remove lockwire and disconnect tube nuts securing hydraulic pressure tube (CP12) (301/8) and return tube (CR03) (301/9) to actuator (301/18) and manifold tees.

          NOTE: Be prepared to catch fuel in container with a minimum capacity of 5 U.S. gallons (19 liters).

      (4) Remove cotter pin (301/1), nut (301/2), bolt (301/3), washer (301/25) (SB PW4ENG 72-498) and bearing stop (301/7) from both sides of support bracket (301/5). Discard cotter pins.
      (5) Use the PWA 85688 Jackscrew Puller and remove the bearing pins (301/4) from both sides of the support bracket (301/5) as follows.
          For each side:
          (a) Install the puller jackscrew into the bearing pin (301/4). Tighten the jackscrew by hand.
          (b) Install the puller sleeve over the jackscrew.
          (c) Install the puller into the sleeve and to the jackscrew. Tighten the puller by hand.
          (d) While you hold the jackscrew with an allen wrench, turn the puller with a spanner wrench or a 0.180 inch (4.572 mm) diameter punch. Turn the puller until you remove the bearing pin (301/4).
      (6) Remove cotter pin (301/21), nut (301/20), washer (301/22) and shoulder bolt (301/23) securing actuator rod end bearing (301/24) to bell crank. Discard cotter pin. Remove actuator from engine and install protective closures.
      (7) If actuator (301/18) is to be replaced comply with the following:
          (a) Remove adapters (301/12) and (301/15) from actuator and discard packings (301/13) and (301/14). Install protective closures.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-16

Task 72-00-35-050-013:

1. Remove PS3 Air Filters

   A. Equipment And Materials Required - None

   B. Procedure

   See Figures 301, 302 and 303.

   (1) Remove the lockwire and disconnect the tubes from the air filters attached to the Flange J brackets at approximately the 11 and the 1:30 o'clock positions.

   (2) FOR THESE MODELS: 4152, 4156A, 4158 (Pre SB PW4ENG 75-85), Remove lockwire from the cap assemblies. Remove the cap assemblies from the air filters.

   (3) Remove the bolts and nuts that attach the air filters to brackets the Flange J brackets. Remove the filters.

   (4) Install protective closures.

   NOTE: FOR THESE MODELS: 4152, 4156A, 4158
   HPC air valve signal tube was removed and cap assemblies installed on the air filter and the HPC air valve by Alert SB (PW4ENG 75-62R2).

   HPC air valve signal tube was (re)installed and the cap assemblies were removed from the air filter and the HPC air valve by SB (PW4ENG 75-85).

Task 72-00-35-050-014:

1. Remove The 9th Stage Start/Stability (2.9) Bleed Valve Thermocouple

A. Equipment And Materials Required - None

B. Procedure

See Figures 301 and 302.

NOTE: Use this procedure for the removal of either the left, the right, or both the thermocouple probes.

(1) Remove the two nuts and the clamp bolt or nut that attach the harness lead to the thermocouple probe and the bracket.

(2) Remove the two bolts, the bracket, and the thermocouple probe from the bleed valve.

(3) Install protection covers.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REMOVAL-18

Task 72-00-35-030-001:

1. Remove The Upper Half Of The HPC Front Case For Access To The 5th Through 8th Stage Blades

A. Prerequisites

(1) Remove the fan-unit from the core-unit. See 72-00-34, Removal-21 Task 72-00-34-020-003.

B. Equipment And Materials Required

Special Tools:

PWA 86564 Sling, HPC Front Split Case

C. Procedure

(1) Remove the tubes from the top left side as follows. See Figure 301.

(a) Remove the lockwire and disconnect the tubes that follow.

1 The HPC air valve and air shutoff valve supply tube (AA22).

2 The air shutoff valve signal tube (AA18).

3 The HPC (left) air valve signal tube (AA06).

4 For engines without the PT4.95 maintenance break at Flange K (Pre SB PW4ENG 73-106), the EEC PT4.95 tube (AS01).

5 For engines with the PT4.95 maintenance break at Flange K (Post SB PW4ENG 73-106), the EEC PT4.95 PT4.95 tube (AS41).

(b) Remove the bolts and nuts that attach the tubes.

(c) Remove the tubes and install the protection covers.

NOTE: For engines without the PT4.95 maintenance break at Flange K (Pre SB PW4ENG 73-106), do not try to remove the (AS01) tube. Move the tube to the rear of Flange H.

(2) Remove the tubes from the top right side as follows: See Figure 302.

(a) Remove the lockwire and disconnect the tubes that follow.

1 The EEC PB tube (AS09).

2 The HPC air valve supply tube (AA25).

3 The HPC air valve signal tube (AA01).

4 The HPC air valve and bleed valve supply manifold (AA24).

5 The (right) bleed valve supply tube (AA28).

6 The (left) bleed valve supply tube (AA30).

(b) Remove the bolts, nuts, and spacers that attach the tubes.

(c) Remove the tubes and install the protection covers.

(3) Disconnect the upper and lower HPC synchronizing rings from each other as follows: See Figure 303.

(a) Remove the bolts and key washers that attach the clevis and plate to each ring.

NOTE: Turn the synchronizing rings as necessary to gain access to the clevis and plate bolts and key washers.

(b) Remove the clevis and plates from each stage.

(4) Remove the twenty two bolts and nuts that attach the top and bottom HPC front cases to each other.

(5) Remove the Flange H hardware as follows (9 - 3 o'clock position). Refer to 72-35-00, Disassembly-21 (Task 72-35-00-030-021).

(6) Attach PWA 86564 Sling to top split case. Use a hoist and carefully raise the top case off of the bottom case. Place case half on storage rack and remove sling.

D. Postrequisites

(1) Remove the desired blades. See Removal−19 (Task 72−00−35−030−002).

Task 72-00-35-030-002:

R 1. Remove The 5th Through 8th Stage Blades (Quick HPC Blade Change)

A. Prerequisites

(1) Remove the upper half of the HPC front case for
R access to the 5th thru 8th stage blades. See Section
R 72-00-35, Removal-18 (Task 72-00-35-030-001).

R B. Equipment And Materials Necessary

Special Tools:
PWA 80257 Drift, Tab Bending
PWA 86190 Extractor

C. Procedure

(1) Locally fabricate a suitable protector to cover the opening between the case and rotor stages to prevent foreign material from falling into the engine.

(2) Determine the number of blades that must be replaced. Refer to Table 301.

Blade Replacement Limits	Stage 5	Stage 6	Stage 7	Stage 8
Maximum number of unpaired blades (Original blades must not be eroded, blended, etc.)	0	2	4	4
Maximum number of pairs	6	8	10	10
Maximum number of blades ordered by computer program	40	51	56	53

Blade Replacement Limits
Table 301

(3) Rotate the rotor as required to remove a blade lock at a damaged blade location. Use a PWA 80257 Drift and a mallet to unbend tabs of the lock. Unbend the tabs of the two blade locks in either the clockwise or

counter−clockwise direction from the first blade lock. See Figure 301.

NOTE: To provide sufficient clearance to rotate the blade lock for removal, it is necessary to move two adjacent blade locks in the clockwise or counterclockwise direction from the first.

(4) For 5th stage blade removal only, use a plastic chisel to remove sealant from the blade lock area.

(5) Drift the locks to position the cut−outs in the first lock at the blade locations. Remove the blade lock. Drift the adjacent locks as necessary to remove them from the disk. Discard the blade locks. Use a vacuum to remove loose sealant particles.

CAUTION: ANY PRESSURE OR FORCE REQUIRED TO REMOVE THE BLADES FROM THE DISK MUST BE APPLIED TO ROOT PLATFORM AREA OF THE BLADE AND NOT TO THE LEADING OR TRAILING EDGE OF THE AIRFOIL. THE AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

R (6) Remove only blades that must be replaced as follows:
R Refer to Table 301.

R (a) In the following step, during blade removal for
R the 5th stage blades, make marks on the 5th stage
R disk to show the location of counterweights, part
R number, and class installed on the 5th stage blade
R roots. Use one of the approved marking methods
R specified in Section 70−11−00 in the Standard
R Practices Manual, PN 585005.

R NOTE: Counterweights must be reinstalled at the
R same location in 72−00−35, Installation−19
R (Task 72−00−35−030−002).

R (b) To remove the 5th thru 7th stage blades, use a drift and mallet at the blade root area to remove blades from the disk.

R (c) To remove the 8th stage blades, use PWA 86190 Extractor and a mallet at the blade root area to remove blades from the disk.

R (d) If the damaged blades exceed the maximum number of pairs limit, then all of the blades in that stage must be replaced.

(7) Use a plastic chisel to remove sealant from the blade roots and blade slots of the rotor as required. Thoroughly vacuum the area to remove sealant particles.

(8) Repeat the above procedure at any other locations that require blade removal.

D. Postrequisites

R (1) Install the desired blades. See Installation-19 (Task
R 72-00-35-430-002).

ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − REMOVAL−20

Task 72−00−35−050−015:

1. Remove The (2.9) Bleed Valve Screen

   A. Equipment And Materials Required − None

   B. Procedure

   See Figure 301.

   (1) Remove the screw and washer from the center of the screen and the four screws which secure the screen to the flange of the valve.

   (2) Remove the screen and install a protective cover over the bleed valve port.

TURBINE VANE COOLING AIR VALVE - REMOVAL-21

Task 72-00-35-050-016:

1. Remove Turbine Vane Cooling Air Valve

   A. Equipment And Material Required - None

   B. Procedure

   See Figure 301.

   (1) Remove the lockwire and disconnect the tube nut on air signal tube (AA76) from the valve.

   (2) Loosen and remove the bolts that attach the flange of the valve to the flange of the (upper) right turbine vane cooling air duct assembly (AP01).

   (3) Remove the bolt and nut that attach the adjustable link rod end to the bracket that is attached to the valve flange.

   (4) Remove the bolts that attach the valve flange and bracket to the HPC boss.

   (5) Remove the turbine vane cooling air valve from the engine. Discard the gaskets.

   (a) If the valve is to be replaced, remove the tube adapter and gasket from the valve.

   (6) Install protection covers to the duct, tube and valve pad.

   NOTE: For additional information concerning detailed maintenance of this component see Air Shut Off Valve Component Maintenance Manual, 75-24-29 (Grimes).

Task 72-00-35-420-001:

1. Install The HPC

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-35-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque the retaining nut as follows:

(2) Trunnion the HPC to front end up. Refer to Assemble The High Pressure Compressor (HPC) (Without Ring Case), 72-35-00, Assembly-01 (Task 72-35-00-400-001) or Assemble The High Pressure Compressor (HPC) (With Ring Case), 72-35-00, Assembly-01 (Task 72-35-00-400-007).

PWA 86002	Retainer (Adapter To HPC Front Hub)
PWA 86596	Adapter, Holding (HPC Front Hub)

Special Tools (Mechanical Wrenching):

PWA 85032	Adapter, Holding (HPC Front Hub)
PWA 85033	Wrench (No. 2 Bearing Nut)
PWA 85034	Wrench (No. 2 Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)

Consumable Materials:

Item No.	Designation
P06-001	Lubricant, Dry Film (PMC 9934)
P09-002	Compound, Anaerobic Retaining (PWA 549-8)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nut	1	72-35-00/1/50

C. Procedure

NOTE: A change to a different HPC module does not require a change in thickness of the classified spacer that has been selected for the No. 2 bearing and seal assembly.

NOTE: Heat is necessary to install the No. 2 bearing and seal assembly on the HPC front hub. An oven or electrical heater is necessary to increase the temperature of the assembly for this procedure.

(1) (Reference 1002) Make a record of Dimensions CC, U, W, and X as follows. See Figure 401 (Sheet 1), Figure 401 (Sheet 2), and Figure 401 (Sheet 3).

(a) If not previously done, measure Dimension CC. Refer to Final Assemble The No. 2 Bearing And Seal Assembly, 72-34-04, Assembly-03 (Task 72-34-04-440-002).

(b) Make a record of Dimension CC on the Worksheet.

(c) Measure the Dimension U on the HPC hub.

(d) Make a record of Dimension U on the Worksheet.

(e) Calculate Dimension T1.

(f) Make a record of calculated Dimension T1 on the Worksheet.

(g) Measure the Dimension W on the nut [1].

(h) Make a record of Dimension W on the Worksheet.

(i) Measure Dimension X on the lock [2].

(j) Make a record of Dimension X on the Worksheet.

(k) Calculate Dimension Y1.

(l) Make a record of calculated Dimension Y1 on the Worksheet.

(2) If you will use an oven to heat the assembly, set the oven temperature now to 300° − 350°F (149° − 177°C).

(3) (Post SB PW4ENG 72−204) If applicable, install the 5th stage HPC shroud retaining ring [12] on the No. 2 bearing and seal assembly as follows. See Figure 402.

(a) Apply Compound P09−002 to the threads of 22 bolts [11].

(b) Align and attach the retaining ring [12] to the assembly with the bolts [11].

(c) Torque the bolts [11] evenly and in small increments to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(4) Install the PWA 103114 Handling Fixture to the No. 2 bearing and seal assembly as follows. See Figure 403.

(a) Turn the assembly to front end up.

(b) Align the dowel pin hole in the Fixture with the dowel pin in the assembly.

(c) Attach the Fixture with the eleven detail bolts.

CAUTION: DO NOT LET THE BEARING INNER RACE TEMPERATURE BE MORE THAN 50°F (28°C) HIGHER THEN THE OUTER RACE TEMPERATURE. THE BEARING OUTER RACE TEMPERATURE CAN BE MORE THAN THE INNER RACE TEMPERATURE.

CAUTION: WHEN YOU HEAT THE ASSEMBLY, THE GEAR MUST BE FREE TO TURN AT ALL TIMES.

(5) (Reference 1002) Heat the No. 2 bearing and seal assembly by one of the methods which follows. See Figure 404 for the PWA 103115 Electrical Heater Method.

(a) Oven Method:

1 Attach a hoist to the Handling Fixture.

2 Put the assembly in the oven.

3 Remove the hoist and sling.

4 Make sure the temperature of the oven is 300° - 350°F (149° - 177°C).

(b) PWA 103115 Electrical Heater Method:

1 Attach a hoist to the Handling Fixture.

2 Put the assembly on a heat resistant surface.

3 Put the Heater on the assembly so that the heat element is inside the bevel gear bore.

4 Connect the PWA 29606 Heater Control to the Heater receptacle and the thermocouple leads.

5 The thermocouple probe must touch the part to be heated.

6 Adjust the Heater Control to a temperature of 300° - 350°F (149° - 177°C).

(6) While the No. 2 bearing and seal assembly heats, prepare the HPC front hub for installation of the assembly as follows. See Figure 405 (Sheet 1).

(a) Insert the shaft and puller plate of the PWA 85030 Hydraulic Pusher into the hub of the HPC and then rotate the plate and install it against the bottom surface of the hub.

(b) Install the Pusher plate and nut at the top of the hub to lock the shaft and plate in position.

(c) Apply a thin layer of Lubricant P06-001 on the hub.

(d) Install either the PWA 3755 or PWA 29389 Hydraulic Pump and PWA 75028 Hydraulic Pressure Gage on the hydraulic cylinder of the Hydraulic Pusher.

CAUTION: YOU MUST PUT A LOAD ON THE BEARING AND SEAL ASSEMBLY IN LESS THAN TWO MINUTES AFTER REMOVAL FROM THE OVEN. IF YOU DO NOT, THE MAY NOT FULLY INSTALL THE ASSEMBLY TO THE HUB.

(7) (Reference 1002) When the No. 2 bearing and seal assembly is at 300° − 350°F (149° − 177°C), install the assembly on the HPC hub as follows. See Figure 405 (Sheet 2) and Figure 405 (Sheet 3).

(a) If the Heater was used, shut off the power and disconnect the Controller from the Heater. Do not remove the Heater from the assembly.

(b) Attach a hoist to the Handling Fixture and move over the HPC.

(c) Align the tabs on the assembly with the slots in the HPC inlet airseal.

(d) Install the assembly on the HPC front hub.

(e) Remove the hoist.

(f) Use protective gloves to carefully remove the Heater.

(g) Install the Pusher detail cover and hydraulic cylinder over the shaft and install the nut.

(h) In less than two minutes after removal from the oven, use the Pusher to put a 5800 psi (39989.6 kPa) load on the assembly for 15 minutes minimum.

(i) After 15 minutes, remove the Pusher, Gage, and Pump.

CAUTION: THE GEAR AND BEARING INNER RACE MUST TURN FREELY AT ALL TIMES. IF NECESSARY, DECREASE THE TEMPERATURE OF THE ID OF THE HPC FRONT HUB WITH CLEAN SHOP AIR.

CAUTION: DO NOT PUT ANYTHING COLD ON THE BEARING. IF YOU PUT SOMETHING COLD ON THE BEARING, YOU WILL MAKE THE OUTER RACE

SMALLER THAN THE INNER RACE, AND THE GEAR WILL NOT TURN.

(j) The gear must turn freely at all times. If necessary, cool the inside of the HPC front hub with clean shop air.

NOTE: If the outer race cools faster than the inner race, it is possible that the gear will not turn.

(k) Turn the No. 2 bearing support assembly to align the pin in the support assembly between the two tabs which are closest together at 6 o'clock position.

CAUTION: WHEN YOU MEASURE THE DIMENSIONS, THE TEMPERATURE OF THE PARTS MUST BE WITHIN 5°F (2.8°C) OF ROOM TEMPERATURE.

(8) (Reference 1002) Make sure that the assembly is fully installed as follows. See Figure 401 (Sheet 1) and Figure 401 (Sheet 4).

(a) Measure Dimension T.

(b) Make a record of the Dimension T on the Worksheet.

(c) The measured Dimension T must not be more than 0.001 inch (0.025 mm) or less than 0.0015 inch (0.038 mm) of the calculated Dimension T1.

(d) If the measurements are not in the limits, you must remove the assembly, do the measurements again, and install the assembly again until the measurements are in the limits.

CAUTION: THE NUT YOU INSTALL MUST BE NEW OR HAVE NEW ANTIGALLANT APPLIED. TO APPLY NEW ANTIGALLANT TO THE NUT, REFER TO 72−35−95, REPAIR−01 (TASK 72−35−95−300−001), PW4000 Series CIR, PN 51A357.

(9) Install the No. 2 bearing nut lock [2] and No. 2 bearing retaining nut [1] to the hub handtight only. See Figure 406.

(a) Make sure that Dimension W and Dimension X are on the Worksheet.

(10) For operators that use the mechanical wrenching tools, install the wrenching tools as follows. See Figure 407.

(a) Engage the PWA 85032 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85033 Wrench over the Adapter and engage the Wrench teeth to the nut [1].

(c) Install the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to torque the nut [1].

(11) For operators that use the hydraulic wrenching tools, install the wrenching tools as follows. See Figure 408.

(a) Engage the PWA 86596 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85512 Wrench over the Adapter and engage the Wrench teeth to the nut [1].

(c) Install the standard hydraulic wrenching tools (from the Standard Wrenching Tools list) to torque the nut [1].

CAUTION: IF YOU REMOVE THE NUT AFTER YOU TORQUE IT, YOU MUST APPLY NEW ANTIGALLANT TO IT. REFER TO 72−35−95, REPAIR−01 (TASK 72−35−95−300−001), PW4000 Series CIR, PN 51A357.

(12) (Reference 974) Torque the No. 2 bearing retaining nut [1] as follows.

(a) Tighten the nut [1] to 4500 − 5500 lb−in. (508.482 − 621.416 N.m).

(b) Turn the nut [1] through an angle of 5 − 10 degrees.

(c) Loosen the nut [1] to zero.

(d) Tighten the nut [1] to 4500 − 5500 lb−in. (508.482 − 621.416 N.m).

(e) Find a common reference point between the nut [1] and its mating part.

(f) Turn the nut [1] through an angle of 5 − 10 degrees.

(g) Loosen the nut [1] to 0 lbf−in.

(h) Tighten the nut [1] to 4500 − 5500 lb−in. (508.482 − 621.416 N.m).

(i) If the reference point of the nut [1] is aligned with the reference point of the mating part, or no more than two degrees beyond it, turn the nut [1] through an angle of 5 − 10 degrees.

(j) If the reference points are not in the limits, do steps (e),(f),(g), and (h) until the reference points are in the limits. Then do step (i).

(k) Remove all the tools except the Adapter and Retainer.

(13) (Reference 1002) Measure and record Dimension Y by one of the methods which follows. See Figure 401 (Sheet 1) and Figure 401 (Sheet 4).

(a) Standard Depth Micrometer Method:

1 Measure Dimension Y with a standard depth micrometer. and record the measurement.

2 Make a record of Dimension Y on the Worksheet.

(b) PWA 102072 Flush Pin Gage Method:

1 Install the Gage on the front face of the HPC front hub.

2 Put the Gage detail flush pin on the nut [1] forward surface.

3 Read and record the measurement, Dimension Y on the digital indicator.

4 Make a record of Dimension Y on the Worksheet.

5 Remove the Gage.

(14) Use the Worksheet to determine if the installation is satisfactory as follows. See Figure 401 (Sheet 1).

(a) Calculate Dimension Y2.

(b) Measured Y must be equal to, or more than, Calculated Y2 by 0.004 inch (0.102 mm).

(c) If the measurements are not in the limits, you must remove the assembly, do the measurements again, install the assembly again until the measurements are in limits.

(15) Install the key washer [29] and retaining ring [28] on the nut [1]. See Figure 409.

(16) Examine the assembly for foreign objects, damage, and correct assembly.

CAUTION: THE No. 2 BEARING RETAINING NUT YOU INSTALL MUST BE NEW.

(17) Install the No. 2 bearing front seal seat [27] with the seal face up and the No. 2 bearing front seal seat nut [26] handtight only. See Figure 409.

(18) (Reference 973) For operators that use the mechanical wrenching tools, install the wrenching tools as follows. See Figure 410.

(a) Install the PWA 85034 Wrench over the Adapter and engage the Wrench teeth to the nut [26].

(b) Install the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to torque the nut [26].

(19) For operators that use the hydraulic wrenching tools, install the wrenching tools as follows. See Figure 411.

(a) Install the PWA 85510 Wrench over the Adapter and engage the Wrench teeth to the nut [26].

(b) Install the standard hydraulic wrenching tools (from the Standard Wrenching Tools list) to torque the nut [26].

CAUTION: IF YOU REMOVE THE NO. 2 BEARING RETAINING NUT AFTER YOU TORQUE IT, YOU MUST THEN INSTALL A NEW NUT.

(20) (Reference 973) Torque the No. 2 bearing face seal nut [26] as follows.

(a) Torque the nut [26] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

(b) Turn the nut [26] through an angle of 9 - 10 degrees, 12 minutes.

(c) Loosen the nut [26] to 0 lb-in. (0.000 N.m).

(d) Torque the nut [26] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

(e) Turn the nut [26] through an angle of 9 - 10 degrees, 12 minutes.

(f) Remove the tools.

(21) Install the key washer [38] and retaining ring [37]. See Figure 412.

(22) Examine the assembly for foreign objects, damage, and correct assembly.

(23) Install the PWA 85537 Handling Fixture to the front of the HPC as follows. See Figure 413.

(a) Install the PWA 88643 Sling or PWA 88673 Sling and two PWA 76154 Adapters to a hoist.

(b) Carefully lift and lower the Fixture to the HPC front case.

(c) Attach the Fixture to the HPC front case with the 36 detail screws, washers, and nuts.

(d) Attach the Fixture to the No. 2 bearing and seal assembly with the 17 detail screws.

(24) Trunnion the HPC to front end down as follows.

(a) Use the hoist, Sling, and Adapters to lift the HPC.

(b) Carefully use a second hoist, Sling, and Adapters on the rear Fixture to turn the HPC to front end down.

(c) Install the HPC front end down in the Stand.

(d) Remove the hoist, Sling, and Adapters from the front Fixture.

R (25) Remove the rear PWA 107219 Fixture as follows. See Figure 414.

(a) Use the PWA 85536 Adapter and the PWA 85530 Wrench to remove the PWA 85535 Nut or PWA 88701 Nut from the HPC rear hub.

(b) Remove the 24 detail bolts.

(c) Use the hoist, Sling, and Adapters to remove the rear Fixture.

(26) Examine the assembly for foreign objects, damage, and correct assembly.

(27) Make sure that you install all the necessary protection covers.

D. Postrequisites

(1) Install The External Plumbing On The High Pressure Compressor. Refer to Installation−03 (Task 72−00−35−420−002).

(2) Install The Diffuser And Combustor. Refer to 72−00−41, Installation−01 (Task 72−00−41−420−001).

(3) Install The Intermediate Case. Refer to 72−00−34, Installation−01 (Task 72−00−34−420−001).

(4) See Figure 415 for more postrequisite tasks.

Task 72-00-35-420-001-002:

1. Install The No. 2 Bearing Seal Seat - Horizontal

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-35-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque the retaining nut as follows.

B. Equipment And Materials Necessary

Standard Wrenching Tools:

Hydraulic:

PWA 18872	Wrench, Hydraulic
Or	
PWA 33732	Wrench, Hydraulic

NOTE: Do not use PWA 87354 or PWA 80070 Hydraulic Wrenches to do this procedure. These wrenches are too heavy and apply too much torque for this horizontal application.

PWA 29510	Pump, Hand (2 Hose)
Or	
PWA 28814	Pump, Electric (2 Hose)
PWA 28815	Cart, Storage (Optional)
Or	
PWA 28825	Cart, Storage (Optional)
Or	
PWA 75046	Cart, Storage (Optional)

Mechanical:

PWA 45418	Wrench, Mechanical
Or	
PWA 80187	Wrench, Mechanical

NOTE: Do not use the PWA 80071 Mechanical Wrench to do this procedure. This wrench is too heavy and applies too much torque for this

Standard Wrenching Tools:

(CONTINUED)

horizontal application.

PWA 45419	Multiplier, Pneumatic
Or	
PWA 80651	Multiplier, Pneumatic (Do Not Use With PWA 45418)
PWA 85375	Plate, Anchor
Or	
PWA 88100	Plate, Anchor

Special Tools:

R	PWA 85368	Arm, Lifting
	PWA 85530	Wrench, Torque (HPC Rear Hub Nut)
R	PWA 106464	Adapter, Lift

Special Tools (Hydraulic Wrenching):

PWA 85510	Wrench (Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)
PWA 86596	Adapter, Holding (HPC Front Hub)

Special Tools (Mechanical Wrenching):

PWA 85032	Adapter, Holding (HPC Front Hub)
PWA 85034	Wrench (No. 2 Front Seal Seat Nut)
PWA 86002	Retainer (Adapter To HPC Front Hub)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Nut	1	72−35−00/1/50

C. Procedure

(1) Install the No. 2 bearing front seal seat [3] to the HPC hub with the larger diameter seal surface forward. See Figure 401.

CAUTION: THE NO. 2 BEARING RETAINING NUT [4] YOU INSTALL MUST BE NEW.

CAUTION: IF YOU REMOVE THE NO. 2 BEARING RETAINING NUT AFTER YOU TORQUE IT, YOU MUST THEN INSTALL A NEW NUT.

(2) Install the new nut [4] handtight only.

(3) (Reference 973) For operators that use the mechanical wrenching tools, torque the nut [4] as follows. See Figure 402 (Sheet 1) and Figure 402 (Sheet 2).

(a) Engage the PWA 85032 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85034 Wrench teeth to the nut [4].

R (c) Use the PWA 85368 Lifting Arm with the PWA 106364
R Lift Adapter and the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to torque the nut [4] as follows.

NOTE: You must fabricate an adapter that will attach the wrench to the Handling Fixture. This adapter must safely lift 125 lbs (56.70 kg) minimum.

1 Torque the nut [4] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

2 Turn the nut [4] through an angle of 9 - 10 degrees, 12 minutes.

3 Loosen the nut [4] to 0 lb-in. (0.000 N.m).

4 Torque the nut [4] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

5 Turn the nut [4] through an angle of 9 - 10 degrees, 12 minutes.

(d) Remove the tools.

(4) (Reference 973) For operators that use the hydraulic wrenching tools, torque the [4] as follows. See Figure 403 (Sheet 1) and Figure 403 (Sheet 2).

(a) Engage the PWA 86596 Adapter teeth to the HPC front hub and attach it with the PWA 86002 Retainer as follows.

1 Install the Retainer through the Adapter and engage the inside of the HPC hub with the detail foot.

2 Install the slotted washer.

3 Tighten the detail nut to make the Adapter tight on the HPC hub.

(b) Install the PWA 85510 Wrench teeth to the nut [4].

R (c) Use the PWA 85368 Lifting Arm with the PWA 106364
R Lift Adapter and the standard mechanical wrenching tools (from the Standard Wrenching Tools list) to torque the nut [4] as follows.

NOTE: You must fabricate an adapter that will attach the wrench to the Handling Fixture. This adapter must safely lift 125 lbs (56.70 kg) minimum.

1 Torque the nut [4] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

2 Turn the nut [4] through an angle of 9 - 10 degrees, 12 minutes.

3 Loosen the nut [4] to 0 lb-in. (0.000 N.m).

4 Torque the nut [4] to 800 - 1200 lb-in. (90.388 - 135.582 N.m).

5 Turn the nut [4] through an angle of 9 - 10 degrees, 12 minutes.

(d) Remove the tools.

(5) Install the key washer [1] and retaining ring [2] completely in the nut [4].

(6) Examine the assembly for foreign objects, damage, and correct assembly.

(7) Make sure that you install all the necessary protection covers.

D. Postrequisites

NOTE: See Figure 404.

(1) Install The No. 1.5 Bearing Support Assembly. Refer to 72-00-34, Installation-06 (Task 72-00-34-430-001).

(2) Install The No. 1 Bearing Support (Front And Rear) Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(3) Install The Low Pressure Turbine And Turbine Exhaust Case. Refer to 72-00-53, Installation-08 (Task 72-00-53-420-002).

(4) Install The Low Pressure Compressor (LPC). Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(5) Install The LPC/LPT Coupling. Refer to 72-00-32, Installation-06 (Task 72-00-32-420-001).

(6) Install All The Stage 1 LPC (Fan) Blade Assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(7) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(8) Install The EEC Speed Transducer (N1) Multiplexer Input Probe. Refer to 72-00-34, Installation-03 (Task 72-00-34-450-001).

Task 72-00-35-420-002:

1. Install External Plumbing To High Pressure Compressor

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-021	Compound, Antigalling (PWA 550-3)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOGUE REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/6/40
Packing	1	79-21-00/6/90
Packing	1	79-21-00/6/120
Packing	2	79-21-00/6/140

Packing	1	79-21-00/6/180

B. Procedure
See Figure 401 and Figure 402.

(1) Install the main bearing strainer element housing assembly as follows.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03-001, to the groove at the flanged end of the housing. Install the housing to the top of the fuel/oil cooler. Attach the housing with four bolts, lubricated with Engine Oil P03-001, and two brackets. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 79-51) Install packings, lubricated with Engine Oil P03-001, to smaller side of adapters (401/1, 401/5) and lubricate threads with Engine Oil P03-001. Install adapters to the front and rear ports and torque to 375 - 425 lb-in. (42.369 - 48.019 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the adapters.

(c) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 79-51) Install packing, lubricated with Engine Oil P03-001, to the smaller ID side of adapter (401/1). Install the adapter, threads lubricated with Engine Oil P03-001and packing side inward, to the front port. Torque the adapter to 450 - 550 lb-in. (50.843 - 62.142 N.m). Install a packing, lubricated with Engine Oil P03-001, to the smaller side of the adapter (401/5) and lubricate the threads with Engine Oil P03-001. Install the adapter to the rear port and torque to 275 - 300 lb-in. (31.071 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety both adapters.

(d) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 79-53), Install packings, lubricated with Engine Oil P03-001, to insert (401/2) and plug (401/3). Lubricate threads and install insert (401/2) to outboard port. Torque insert (401/2) to 150 - 170 lb-in. (16.948 - 19.207 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the insert. Install plug (401/3) and torque to 65 - 75 lb-in. (7.344 - 8.474 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(e) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 79-53), Install a packing lubricated with Engine Oil P03-001 to the plug (401/3). Install the plug into the main bearing strainer housing and torque to 65 - 75 lb-in. (7.344 - 8.474 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Install packing, lubricated with Engine Oil P03-001, to larger side of adapter (401/4). Install adapter (401/4), threads lubricated with Engine Oil P03-001, to inboard port and torque to 450 - 550 lb-in. (50.843 - 62.142 N.m).

(g) FOR THESE MODELS: 4152, 4156A, 4158
Install packing, lubricated with Engine Oil P03-001, to groove in strainer. Install strainer and secure with bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(h) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the packing, lubricated with Engine Oil P03-001, to the smaller ID side of adapter (401/4). Install the adapter, threads lubricated with Engine Oil P03-001 and packing side inward, to the front port. Torque the adapter to 450 - 550 lb-in. (50.843 - 62.142 N.m). Install a packing, lubricated with Engine Oil P03-001, to the smaller side of the adapter (401/2) and lubricate the threads with Engine Oil P03-001. Install the adapter to the rear port and torque to 275 - 300 lb-in. (31.071 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety both adapters.

(i) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install a packing lubricated with Engine Oil P03-001 to the plug (401/3). Install the plug into the main bearing strainer housing and torque to 65 - 75 lb-in. (7.344 - 8.474 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(j) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install packing, lubricated with Engine Oil P03-001, to the larger side of the adapter (401/1). Install adapter (401/1), threads lubricated with Engine Oil P03-001, to the inboard port and torque to 450 - 550 lb-in. (50.843 - 62.142 N.m).

(k) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install packing, lubricated with Engine Oil P03−001, to the groove in the strainer. Install the strainer and attach with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(2) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−85 and Pre SB PW4ENG 75−116) Install the HPC air valve signal tube assembly (AA15) on the right side of the engine. See Figure 402.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protection covers and lubricate the tube nut threads with Engine Oil P03−001. Install the tube to the rear of the lower right air filter at approximately the 2 o'clock position and to the HPC secondary flow control valve at approximately the 3:30 o'clock position forward of Flange J.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install a clamp, bolt, threads lubricated with Engine Oil P03−001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Torque the tube nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nuts.

(3) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−116) Install the HPC air valve signal tube assemblies (AA89) and (AA91) on the right side of the engine.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protection covers.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install the (AA89) tube to the rear of the lower right air filter at approximately the 2 o'clock position. Install the check valve on the lower end of the tube just above the tube tee.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install the HPC air valve signal tube assembly (AA91) on the (AA89) tube tee at approximately the 2:30 o'clock position forward of Flange J. Install the lower end of (AA91) tube to the HPC secondary flow control valve at approximately the 3:30 o'clock position forward of Flange J.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) FOR THESE MODELS: 4152, 4156A, 4158
Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(4) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75-102 and SB PW4ENG 75-116) Install air shutoff valve signal tube assembly (upper) (AA20) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protective closures and lubricate the tube nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Position tube to Flange J brackets.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flange J brackets at approximately 10 o'clock and 12 o'clock positions. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(5) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75-116) Install air shutoff valve signal tube assembly (lower) (AA21) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove protective closures and lubricate tube nut threads at elbow end with Engine Oil P03-001, and at straight end with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the elbow end of tube to turbine cooling air shutoff valve at approximately 3 o'clock position and to previously installed tubes at approximately 2 o'clock position rearward of Flange J handtight only.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to valve flange at approximately 3 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Torque tube nut at elbow end of tube to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut. Torque tube nut at straight end of tube to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

(6) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75-116) Install air shutoff valve signal tube assembly (lower) (AA90) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove protective closures and lubricate tube nut threads at elbow end with Engine Oil P03-001, and at straight end with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the elbow end of tube to turbine cooling air shutoff valve at approximately 3 o'clock position. Install the opposite tube end to the check valve installed before on tube (AA89) at approximately the 2 o'clock position rearward of Flange J handtight only.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to bracket attached to valve flange at approximately 3 o'clock position. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Torque tube nut at elbow end of tube to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. Torque tube nut at straight end of tube to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(7) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the turbine vane and blade cooling air valve signal tube assembly (AA77) as follows.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the protective covers and lubricate the tube nut threads at the U shaped end of the tube with Engine Oil P03−001, and at the 90 degree elbow end of the tube with Antigalling Compound P06−021. Install the tube nut at the U shaped end of the tube to the turbine vane and blade cooling air valve at approximately the 3 o'clock position and the opposite tube nut to the (lower) air filter at approximately the 1:30 o'clock position.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach the tube to the bracket on the turbine vane and blade cooling air valve flange with a clamp, a bolt, threads lubricated with Engine Oil P03−001, and nut. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque the tube nut that is attached to the valve to 270 − 300 lb−in. (30.506 − 33.895 N.m). Torque the tube nut that is attached to the air filter to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nuts.

(8) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the turbine vane cooling air valve pressure tube assembly (AA76) as follows.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Remove the protective covers and lubricate the
R tube nuts with Antiseize Paste P06-054. Remove
R the unwanted paste. Install the tube to the (lower) air filter, on the left side of the engine, at approximately the 11 o'clock position and the opposite end of the tube to the turbine vane cooling air valve at the 2 o'clock position on the HPC case.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Attach the tube to the brackets on Flange J at the 10, 11:30, and 1 o'clock positions with clamps, bolts, threads lubricated with Engine Oil P03-001 and nuts. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(9) Install (left) bleed valve supply tube assembly (AA30) as follows.

R (a) Remove the protective closures and lubricate the
R tube nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the tube to left HPC bleed valve at approximately 11 o'clock position handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to bracket below and bracket rear of turbine cooling air valve actuator at approximately 2 o'clock position handtight only.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flange J brackets at approximately 1, 12 and 11 o'clock positions handtight only.

(d) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque tube nut to 200 - 225 lb-in. (22.597 - 23.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

(10) Install (right) bleed valve supply tube assembly (AA28) as follows.

R (a) Remove the protective closures and lubricate the
R tube nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the tube to
HPC right side bleed valve at approximately 1 o'clock position handtight only.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange J bracket at approximately 1 o'clock position handtight only.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to bracket below and bracket rear of turbine cooling air valve actuator at approximately 2 o'clock position handtight only.

(d) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

(11) Install air supply manifold assembly (AA24) as follows.

R (a) Remove the protective closures and lubricate
R the manifold nut threads with Antiseize Paste
R P06-054. Remove the unwanted paste. Install the
manifold to front of upper right air filter at approximately 2 o'clock position handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing manifold to bracket below and bracket rear of turbine cooling air valve actuator at approximately 2 o'clock position. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque manifold nut to filter to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(12) (Reference 736) Tighten and torque the two bolts that attach the clamp bracket and ground cable to the turbine case cooling actuator support bracket to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(13) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75-102 and SB PW4ENG 75-116) Install air shutoff valve signal manifold assembly (left) (AA19) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
R Remove the protective closures and lubricate the
R manifold nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the manifold
to rear of upper left air filter at approximately the 11 o'clock position and to the turbine vane cooling air valve at approximately the 10 o'clock position handtight only. Connect tube nut to tee handtight only.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Torque all three manifold nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(14) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75-102 and SB PW4ENG 75-116) Install air shutoff valve signal manifold assembly (left) (AA19) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
R Remove the protective closures and lubricate the
R manifold nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the manifold
to rear of upper left air filter at approximately the 11 o'clock position and to the turbine vane cooling air valve at approximately the 10 o'clock position handtight only.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Torque the two manifold nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(15) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install air shutoff valve signal manifold assembly (left) (AA19) as follows.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Remove the protective closures and lubricate the
R manifold nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the manifold
to rear of upper left air filter at approximately the 11 o'clock position and to the turbine vane cooling air valve at approximately the 10 o'clock position handtight only.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Torque the two manifold nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(16) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75-85 and SB PW4ENG 75-116) Install the HPC air valve signal tube assembly (AA16) on the left side of the engine.

(a) FOR THESE MODELS: 4152, 4156A, 4158
R Remove the protection covers and lubricate the
R tube nut threads with Antiseize Paste P06-054.
R Remove the unwanted paste. Install the tube
to the rear of the lower left air filter at approximately the 11 o'clock position and to the HPC secondary flow control valve approximately at the 10 o'clock position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Torque the tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nuts.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
HPC air valve signal tube was removed and cap assemblies installed on the air filter and the HPC air valve by Alert SB PW4ENG 75−62R2.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
HPC air valve signal tube was re−installed and the cap assemblies were removed from the air filter and the HPC air valve by SB PW4ENG 75−85.

Task 72-00-35-450-001-A:

1. Install Fuel/Oil Cooler - For Engines Not Equipped With Front Split Mount Bracket (Pre SB PW4ENG 79-20)

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70	Strap Wrench (Optional To Glenair TG-69)
Glenair TG-69	Soft Jawed Pliers (Optional To Glenair TG-70)
Bergen Mechanical Crimper	(Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-021	Compound, Antigalling (PWA 550)
	P06-036	Compound, Antigallant (PWA 36035)
R	P06-054	Paste, Antiseize (PWA 36246)
	P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	79-21-00/05/080
Packing	1	79-21-00/11/001

Retainer	2	73−12−00/03/160

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) If new replacement fuel/oil cooler is to be installed, comply with the following. See Figure 401.

(a) Remove protective closures.

(b) Install fuel/oil cooler bypass valve. See Installation−11 Task 72−00−35−450−008.

(c) Install pin, threads lubricated with Engine Oil P03−001, to front mounting ear and secure with washer and nut. Torque nut to 550 − 750 lb−in. (62.142 − 84.739 N.m) aligning cotter pin hole. Install cotter pin and secure.

(d) Install adapter (inlet return), threads lubricated with Engine Oil P03−001, and packing, lubricated with Engine Oil P03−001, to fuel/oil cooler port. Torque adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(e) Install elbow and jamnut, threads lubricated with Engine Oil P03−001, and packing, lubricated with Engine Oil P03−001, to fuel/oil cooler port handtight only. (Elbow jamnut to be torqued after alignment of elbow with drain tube).

(f) Install two adapters (fuel inlet) and one adapter (fuel outlet), threads lubricated with Engine Oil P03−001, and packings, lubricated with Engine Oil P03−001, to fuel/oil cooler ports. Torque three adapters to 650 − 750 lb−in. (73.440 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Install two plugs (drain), threads lubricated with Engine Oil P03−001, and packings, lubricated with Engine Oil P03−001, to fuel/oil cooler ports. Torque two plugs to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(h) Install plug (airframe outlet), threads lubricated with Engine Oil P03−001, and packing, lubricated with Engine Oil P03−001, to fuel/oil cooler port. Torque plug, to 375 − 425 lb−in. (42.369 − 48.019 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(2) Install fuel/oil cooler as follows. See Figure 404.

(a) Remove protective closures.

(b) Lubricate adapter (inlet return) threads with Engine Oil P03−001. Lubricate remaining adapters on fuel/oil cooler and bypass valve with Antigalling Compound P06−021.

(c) Install packing, lubricated with Engine Oil P03−001, and retainer to each of the following tubes at fuel/oil cooler end:

1 Oil cooler inlet fuel tube (two).

2 Oil cooler inlet oil tube (airframe).

3 Air cooler outlet oil hose and tube assembly.

4 Oil cooler bypass drain tube.

5 Oil cooler outlet fuel tube.

(d) Install two packings, lubricated with Engine Oil P03−001, to lower flanged ends of oil cooler inlet fuel tubes. Ensure W3 and W5 harness is positioned forward and install cooler (rearward end first). See Figure 402. Move cooler forward (inboard of harness and rear of cooler raised off tubes) to engage front mount pin. Ensure all tubes are aligned and lower rear of cooler onto tubes.

(e) Install loop clamp bracket to top bolt hole of rear mount. Secure rear mount with four bolts, threads lubricated with Engine Oil P03−001, and three washers (omit washer at bracket). Torque bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(3) Torque and secure tubes to fuel/oil cooler and fuel/oil cooler bypass valve adapters as follows. See Figure 404.

(a) (Reference 2170) Torque the oil cooler outlet fuel tube nut (FM11) to 150 − 160 lb−in. (16.948 − 18.078 N.m). Torque the tube nuts again to 150 − 160 lb−in. (16.948 − 18.078 N.m) until the torque is kept.

(b) Torque oil cooler bypass drain tube (LP20) to 65 − 70 lb−in. (7.344 − 7.909 N.m), then loosen and retorque to same value.

(c) Torque oil cooler inlet return manifold (CR04) to 200 − 225 lb−in. (22.597 − 25.422 N.m) at front of cooler.

(d) Connect both ends of oil cooler inlet fuel tubes (two) (FM10) and (FM12) to fuel/oil cooler and to fuel pump and bypass valve. Secure bottom tube flanges with six bolts, threads lubricated with Engine Oil P03−001, handtight only. Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tubes to HPC case brackets at two locations. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque six bolts securing tube flanges to fuel pump and fuel bypass valve to 85 − 95 lb−in. (9.604 − 10.734 N.m). (Reference 2170) Torque the tube nuts to the fuel oil cooler to 150 − 160 lb−in. (16.948 −

18.078 N.m). Torque the tube nuts again to 150 − 160 lb−in. (16.948 − 18.078 N.m) until the torque is kept.

(e) Lubricate union at approximately 6 o'clock
R position with Antiseize Paste P06−054 and connect
oil cooler inlet oil tube (LS05) (airframe)
to fuel/oil cooler bypass valve and to union
R handtight only. Wipe off unwanted paste. Secure
tube to previously installed fuel inlet tube at two locations using clamp, bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque tube to union to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. Torque nut to bypass valve to 140 − 160 lb−in. (15.818 − 18.078 N.m), then loosen and retorque to same value.

(f) Connect air cooler outlet oil hose and tube assembly (LP03) to bypass valve handtight only. Secure tube to HPC case bracket and EEC wiring harness support tube using clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque hose and tube assembly nut to bypass valve to 100 − 110 lb−in. (11.298 − 12.428 N.m), then loosen and retorque to same value.

(g) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to all the tubes torqued to the bottom of the fuel/oil cooler and the fuel/oil cooler bypass valve adapters.

NOTE: Forward inboard oil cooler inlet fuel tube to be lockwired to forward outboard wire hole in bypass valve gasket.

(4) Install main bearing strainer housing as follows. See Figure 403.

(a) Remove protective closures.

(b) Lubricate threads of two largest adapters (front and rear of strainer housing) with Antigalling Compound P06−021. Lubricate threads of smaller
R adapter (inboard side of housing) with Antiseize
R Paste P06−054. Wipe off unwanted paste.

(c) Install packing, lubricated with Engine Oil P03−001, and retainer to the No. 1, 1.5 and 2 main bearing oil pressure manifold.

(d) Install packing, lubricated with Engine Oil P03−001, to groove in flange of main bearing strainer housing. Install housing to top of fuel/oil cooler engaging tubes to adapters.

(e) Secure housing to fuel/oil cooler with four bolts, threads lubricated with Engine Oil P03−001, and brackets attached to W5 harness. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Install the No. 3 bearing oil pressure manifold (LP18) as follows:

CAUTION: DO THIS PROCEDURE EXACTLY AS FOLLOWS OR TUBE FAILURE CAN RESULT. YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

1 Be sure and loosen
- (Pre SB PW4ENG 79−52), the clamp bolt that attaches the No. 3 bearing oil strainer (LP19) to the Flange K bracket
- (Post SB PW4ENG 79−52), the clamp bolts that attaches the ferrule end (contains the oil strainer) of the No. 3 bearing pressure tube (LP19) to the bracket on Flange K
- the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing.

2 (Pre SB PW4ENG 79-52), Lubricate the back of the manifold ferrules per Figure 406 (Sheet 1) with Antigallant Compound P06-036. Lubricate the forward tube nut threads with Antigalling Compound P06-021. Lubricate the rear tube nut
R threads with Antiseize Paste P06-054. Wipe off
R unwanted paste. Lubricate the packing with Engine Oil P03-001. Install the packing and retainer to the tube.

3 (Post SB PW4ENG 79-52), Lubricate the back of the manifold ferrules and the manifold nut threads with Antigallant Compound P06-021. See Figure 406 (Sheet 2). Lubricate the packing with Engine Oil P03-001 and install the packing and retainer to the manifold.

4 Install the manifold (LP18) to the strainer housings. Tighten by hand.

5 Lubricate the threads of the oil tube metering nipple (restrictor) with Antigalling Compound P06-021. Lubricate the back of the ferrules on the oil trim pressure tubes (LP31) and (LP32) per Figure 406 (Sheet 1) with Antigallant Compound P06-036. Install the nipple to the two oil trim pressure tubes (LP31) and (LP32). Tighten by hand.

6 Lubricate the clamp bolts with Engine Oil P03-001 and install the attaching hardware for the No. 3 bearing oil pressure manifold and the oil trim pressure tube.

7 (Reference 2016) Be sure that the center of the forward clamp (on the oil trim pressure tube) is 2.500 - 3.000 inch (63.500 - 76.200 mm) from the center of the rear clamp (Post SB PW4ENG 72-211 only).

8 Torque the clamp bolts and tubes exactly as follows:
- the clamp bolt that attaches the back to back clamps (LP18) to (LP32) to 36 - 40 lb-in. (4.067 - 4.519 N.m)
- the clamp bolt(s) that attach the tubes to the oil cooler rear bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m)
- (Pre SB PW4ENG 79-52), the clamp bolt that

attaches the No. 3 bearing oil strainer (LP19) to the Flange K bracket to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- (Post SB PW4ENG 79−52), the bolts that attach the ferrule end of the No. 3 bearing pressure tube (LP19) to the bracket on Flange K to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing to 85 − 95 lb−in. (9.604 − 10.734 N.m)
- the front tube nut of the (LP18) manifold to strainer housing to 140 − 160 lb−in. (15.818 − 18.078 N.m), then loosen and torque again to the same value
- the tube nuts (LP31) and (LP32), that attach the oil tube metering nipple (restrictor) to 675 − 750 lb−in. (76.265 − 84.739 N.m)
- (Post SB PW4ENG 79−52), Install a clamp to the tube nut end of the oil trim pressure tube (LP32) and attach the clamp to a bracket on the secondary flow control valve flange with a bolt, lubricated with Engine Oil P03−001 and a nut. Torque the nut to 36 − 40 (4.067 − 4.519 N.m)
- (Pre SB PW4ENG 79−52), the manifold nut (LP18) to the No. 3 bearing oil strainer at Flange K to 675 − 750 lb−in. (76.265 − 84.739 N.m)
- (Post SB PW4ENG 79−52), the manifold nut (LP18) to the adapter in the No. 3 bearing oil pressure tube (LP19) at Flange K to 675 − 750 lb−in. (76.265 − 84.739 N.m).

(g) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 at all necessary locations,

(h) (Pre SB PW4ENG 79−52), Install the spray shield to the inboard side of the rear manifold (LP18) connection.

(i) (Pre SB PW4ENG 79−52), (Reference 2151) Attach the shield with the hose clamp and torque the clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

R
R

(j) (Post SB PW4ENG 79−52), Install the spray shield to the inboard side of the rear manifold (LP18) that is attached to the No. 3 bearing pressure tube (LP19). Attach the spray shield with a clamp and a bolt, threads lubricated with Engine Oil P03−001, to a bracket attached to the flange of the cooling air tube on the high compressor. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(k) Install the No. 1, 1.5 and 2 main bearing oil pressure tube (LP05) as follows.

1 Apply Antigalling Compound P06−021 to the threads of the tube nuts.

2 Install the tube to the strainer housings (packing and retainer at the rearward end installed) and tighten by hand.

3 Torque the clamp bolt that attaches the tube to the bracket on Flange E to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 (Post SB PW4ENG 79−33), Attach the clamp on the tube to a bracket on the main bearing breather tube (LB06) with a nut and bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 403 (Sheet 2).

5 Torque the forward tube nut to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install lockwire to the tube nut.

6 Torque the rear tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m), and then loosen to zero torque. Torque the rear tube nut a second time to 140 − 160 lb−in. (15.818 − 18.078 N.m). Install lockwire to the tube nut.

(l) Connect and torque gearbox oil pressure manifold (LP08) to 675 − 750 lb−in. (76.265 − 84.739 N.m) and secure with lockwire.

(5) Attach and connect harnesses to fuel/oil cooler and fuel/oil cooler bypass valve as follows. See Figure 405.

(a) Install two loop clamp brackets.

  1 Remove four bolts and washers from front flange of fuel/oil cooler.

  2 Secure two loop clamp brackets to front flange with four bolts, threads lubricated with Engine Oil P03−001. Omit washers.

  3 Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Connect the W5P5 and the W3P5 harness connectors to the bypass valve solenoid front and rear, respectively, harness receptacles as follows. For each connector:

  1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

  2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

  NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

  CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

  3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
  - the connector coupling nut is fully tight
  - the connector fits tightly against the receptacle (metal to metal).

- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(c) Install three bolts and two nuts, threads lubricated with Engine Oil P03-001, securing W3 and W5 harnesses to brackets attached to front of cooler and to bracket below cooler. Torque bolts and nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Task 72-00-35-450-001-B:

2. Install Fuel/Oil Cooler - For Engines Equipped With Front Split Mount Bracket (Post SB PW4ENG 79-20)

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70	Strap Wrench (Optional to Glenair TG-69)
Glenair TG-69	Soft Jawed Pliers (Optional to Glenair TG-70)
Bergen Mechanical Crimper	(Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
R	P03-001	Oil, Engine (PWA 521B)
	P06-021	Compound, Antigalling (PWA 550)
	P06-036	Compound, Antigallant (PWA 36035)
R	P06-054	Paste, Antiseize (PWA 36246)
	P11-009	Alcohol, Denatured Ethyl(AMS 3002)

Expendable Parts:

B. Procedure
See Figure 407, Figure 408, Figure 409, Figure 410 and Figure 411.

(1) If new replacement fuel/oil cooler is to be installed, comply with the following as follows. See Figure 407.

(a) Remove protective closures.

(b) Install fuel/oil cooler bypass valve. See Installation-11 Task 72-00-35-450-008.

(c) Install bracket retainer and pin, threads lubricated with Engine Oil P03-001, to front mounting ear and secure with washer and nut. Torque nut to 550 - 750 lb-in. (62.142 - 84.739 N.m) aligning cotter pin hole. Install cotter pin and secure.

(d) Install adapter (inlet return), threads lubricated with Engine Oil P03-001, and packing, lubricated with Engine Oil P03-001, to fuel/oil cooler port. Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(Task 72−00−35−450−001−A)

(e) Install elbow and jamnut, threads lubricated with Engine Oil P03−001, and packing, lubricated with Engine Oil P03−001, to fuel/oil cooler port. (Elbow jamnut to be torqued after alignment of elbow with drain tube).

(f) Install two adapters (fuel inlet) and one adapter (fuel outlet), threads lubricated with Engine Oil P03−001, and packings, lubricated with Engine Oil P03−001, to fuel/oil cooler ports. Torque three adapters to 650 − 750 lb−in. (73.440 − 84.739 N.m) and secure with lockwire.

(g) Install two plugs (drain), threads lubricated with Engine Oil P03−001, and packings, lubricated with Engine Oil P03−001, to fuel/oil cooler ports. Torque two plugs to 110 − 120 lb−in. (12.428 − 13.558 N.m) and secure with lockwire.

(h) Install plug (airframe outlet), threads lubricated with Engine Oil P03−001, and packing, lubricated with Engine Oil P03−001, to fuel/oil cooler port. Torque plug, to 375 − 425 lb−in. (42.369 − 48.019 N.m) and secure with lockwire.

(2) Install fuel/oil cooler as follows. See Figure 410.

(a) Remove protective closures.

(b) Lubricate adapter (inlet return) threads with Engine Oil P03−001. Lubricate remaining adapters on fuel/oil cooler and bypass valve with Antigalling Compound P06−021.

(c) Install packing, lubricated with Engine Oil P03−001, and retainer to each of the following tubes:

1 Oil cooler inlet fuel tube (two) (FM10) and (FM12).

2 Oil cooler inlet oil tube (airframe) (LS05).

3 Air cooler outlet oil hose and tube assembly (LP03).

4 Oil cooler bypass drain tube (LP20).

5 Oil cooler outlet fuel tube (FM11).

(d) Install oil cooler front bracket to pin and engage retainer. See Figure 408. Ensure W3 and W5 harness is positioned forward and install cooler (rearward end first). Move cooler forward (inboard of harness) and lower onto tubes and HPC case brackets. Ensure all tubes are aligned and engaged in adapters. Install two bolts, threads
R lubricated with Antiseize Paste P06−054, to front bracket and torque to 125 − 140 lb−in. (14.123 −
R 15.818 N.m). Wipe off unwanted paste.

(e) Slide loop clamp bracket forward to top bolt hole of rear mount. Secure rear mount with four bolts, threads lubricated with Engine Oil P03−001, and three washers (omit washer at bracket). Torque bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(3) Torque and secure tubes to fuel/oil cooler and fuel/oil cooler bypass valve adapters as follows. See Figure 410.

(a) (Reference 2170) Torque the oil cooler outlet fuel tube nut (FM11) and the oil cooler inlet fuel tubes (FM10) and (FM12) to 150 − 160 lb−in. (16.948 − 18.078 N.m). Torque the tube nuts again to 150 − 160 lb−in. (16.948 − 18.078 N.m) until the torque is kept.

(b) Torque oil cooler bypass drain tube (LP20) to 65 − 70 lb−in. (7.344 − 7.909 N.m), then loosen and retorque to same value.

(c) Torque air cooler outlet oil tube (LP03) to 200 − 220 lb−in. (22.597 − 24.857 N.m), then loosen and retorque to same value.

(d) Torque oil cooler inlet oil tube (airframe) (LS05) to 140 − 160 lb−in. (15.818 − 18.078 N.m), then loosen and retorque to same value.

(e) Torque oil cooler inlet return manifold (CR04) to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(f) Lockwire all tubes torqued to bottom of fuel/oil cooler and fuel/oil cooler bypass valve adapters.

NOTE: Forward inboard oil cooler inlet fuel tube to be lockwired to forward outboard wire hole in bypass valve gasket.

(4) Install main bearing strainer housing as follows. See Figure 409.

(a) Remove protective closures.

(b) Lubricate threads of two largest adapters (front and rear of strainer housing) with Antigalling Compound P06−021. Lubricate threads of smaller
R adapter (inboard side of housing) with Antiseize
R Paste P06−054. Wipe off unwanted paste.

(c) Install packing, lubricated with Engine Oil P03−001, and retainer to the No. 1, 1.5, and 2 main bearing oil pressure manifold.

(d) Install packing, lubricated with Engine Oil P03−001, to groove in flange of main bearing strainer housing. Install housing to top of fuel/oil cooler engaging tubes to adapters.

(e) Secure housing to fuel/oil cooler with four bolts, threads lubricated with Engine Oil P03−001, and brackets attached to W5 harness. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Install the No. 3 bearing oil pressure manifold (LP18) as follows:

CAUTION: DO THIS PROCEDURE EXACTLY AS FOLLOWS OR TUBE FAILURE CAN RESULT. YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY

OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

1 Be sure and loosen
  - (Pre SB PW4ENG 79-52), the clamp bolt that attaches the No. 3 bearing oil strainer (LP19) to the Flange K bracket
  - (Post SB PW4ENG 79-52), the clamp bolts that attaches the ferrule end (contains the oil strainer) of the No. 3 bearing pressure tube (LP19) to the bracket on Flange K
  - the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing.

2 (Pre SB PW4ENG 79-52), Lubricate the back of the manifold ferrules per Figure 412, (Sheet 1) with Antigallant Compound P06-036. Lubricate the forward tube nut threads with Antigalling Compound P06-021. Lubricate the rear tube nut
R threads with Antiseize Paste P06-054. Wipe off
R unwanted paste. Lubricate the packing with Engine Oil P03-001. Install the packing and retainer to the tube.

3 (Post SB PW4ENG 79-52), Lubricate the back of the manifold ferrules and the manifold nut threads with Antigallant Compound P06-021. Lubricate the packing with Engine Oil P03-001 and install the packing and retainer to the manifold. See Figure 412 (Sheet 2).

4 Install the manifold (LP18) to the strainer housings. Tighten by hand.

5 Lubricate the threads of the oil tube metering nipple (restrictor) with Antigalling Compound P06-021. Lubricate the back of the ferrules on the oil trim pressure tubes (LP31) and (LP32) per Figure 412, (Sheet 1) with Antigallant Compound P06-036. Install the nipple to the two oil trim pressure tubes (LP31) and (LP32). Tighten by hand.

6 Lubricate the clamp bolts with Engine Oil P03-001 and install the attaching hardware for the No. 3 bearing oil pressure manifold and the oil trim pressure tube.

7 (Reference 2016) Be sure that the center of the forward clamp (on the oil trim pressure tube) is 2.500 − 3.000 inch (63.500 − 76.200 mm) from the center of the rear clamp (Post SB PW4ENG 72−211 only).

8 Torque the clamp bolts and tubes exactly as follows:

- the clamp bolt that attaches the back to back clamps (LP18) to (LP32) to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- the clamp bolt(s) that attach the tubes to the oil cooler rear bracket to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- (Pre SB PW4ENG 79−52), the clamp bolt that attaches the No. 3 bearing oil strainer (LP19) to the Flange K bracket to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- (Post SB PW4ENG 79−52), the bolts that attach the ferrule end of the No. 3 bearing pressure tube (LP19) to the bracket on Flange K to 36 − 40 lb−in. (4.067 − 4.519 N.m)
- the three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing to 85 − 95 lb−in. (9.604 − 10.734 N.m)
- the front tube nut of the (LP18) manifold to strainer housing to 140 − 160 lb−in. (15.818 − 18.078 N.m), then loosen and torque again to the same value
- the tube nuts (LP31) and (LP32), that attach the oil tube metering nipple (restrictor) to 675 − 750 lb−in. (76.265 − 84.739 N.m)
- (Post SB PW4ENG 79−52), Install a clamp to the tube nut end of the oil trim pressure tube (LP32) and attach the clamp to a bracket on the secondary flow control valve flange with a bolt, lubricated with Engine Oil P03−001 and a nut. Torque the nut to 36 − 40 (4.067 − 4.519 N.m)
- (Pre SB PW4ENG 79−52), the manifold nut (LP18) to the No. 3 bearing oil strainer at Flange K to 675 − 750 lb−in. (76.265 − 84.739 N.m)
- (Post SB PW4ENG 79−52), the manifold nut (LP18) to the adapter in the No. 3 bearing oil pressure tube (LP19) at Flange K to 675 − 750 lb−in. (76.265 − 84.739 N.m).

(g) Install the lockwire at all necessary locations.

(h) (Pre SB PW4ENG 79−52), Install the spray shield to the inboard side of the rear manifold (LP18) connection.

(i) (Pre SB PW4ENG 79−52), (Reference 2151) Attach the shield with the hose clamp and torque the clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(j) (Post SB PW4ENG 79−52), Install the spray shield to the inboard side of the rear manifold (LP18) that is attached to the No. 3 bearing pressure tube (LP19). Attach the spray shield with a clamp and a bolt, threads lubricated with Engine Oil P03−001, to a bracket attached to the flange of the cooling air tube on the high compressor. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(k) Install the No. 1, 1.5 and 2 main bearing oil pressure tube (LP05) as follows.

  1 Apply Antigalling Compound P06−021 to the threads of the tube nuts.

  2 Install the tube to the strainer housings (packing and retainer at the rearward end installed) and tighten by hand.

  3 Torque the clamp bolt that attaches the tube to the bracket on Flange E to 36 − 40 lb−in. (4.067 − 4.519 N.m).

  4 (Post SB PW4ENG 79−33), Attach the clamp on the tube to a bracket on the main bearing breather tube (LB06) with a nut and bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 403 (Sheet 2).

  5 Torque the forward tube nut to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install lockwire to the tube nut.

6 Torque the rear tube nut to 140 − 160 lb−in. (15.818 − 18.078 N.m), and then loosen to zero torque. Torque the rear tube nut a second time to 140 − 160 lb−in. (15.818 − 18.078 N.m). Install lockwire to the tube nut.

(l) Connect and torque the gearbox oil pressure manifold (LP08) to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install lockwire to the tube nut.

(5) Attach and connect harnesses to fuel/oil cooler and fuel/oil cooler bypass valve as follows. See Figure 411.

(a) Install two loop clamp brackets.

1 Remove four bolts and washers from front flange of fuel/oil cooler.

2 Secure two loop clamp brackets to front flange with four bolts, threads lubricated with Engine Oil P03−001. Omit washers.

3 Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Connect the W5P5 and the W3P5 harness connectors to the bypass valve solenoid front and rear, respectively, harness receptacles as follows. For each connector:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

(c) Install three bolts and two nuts, threads lubricated with Engine Oil P03−001, securing W3 and W5 harnesses to brackets attached to front of cooler and to bracket below cooler. Torque bolts and nuts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

Task 72-00-35-450-002:

1. Install Turbine Case Cooling (TCC) Air Valve Actuator

A. Equipment And Materials Required

Standard Tools:

Glenair TG−70 Strap Wrench or
Glenair TG−69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P11−009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	75−24−00/11/130
Packing	1	75−24−00/11/150
Packing	1	75−24−00/11/170

B. Procedure

See Figure 401.

(1) If new actuator is being installed, comply with the following.

  (a) Check to ensure that actuator moves freely on mount rails.

  (b) Remove protective closures.

  (c) Install the new packing (401/1), lubricated with Engine Oil P03−001, to the plug (401/2).

(d) Install the plug (401/1), threads lubricated with Engine Oil P03−001, to the lower rear port of actuator. Torque the plug (401/2) to 90 − 100 lb−in. (10.169 − 11.298 N.m). Safety the plug (401/2) with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(2) If necessary, the hydraulic pressure and the hydraulic return adapters and their packings can be replaced as follows.

(a) Install the new packing (401/3), lubricated with Engine Oil P03−001, to the hydraulic pressure adapter (401/4).

(b) Install the hydraulic pressure adapter (401/4), threads lubricated with Engine Oil P03−001, to the upper (largest) port of the actuator. Tighten the adapter (401/4) to a snug fit.

(c) Install the new packing (401/6), lubricated with Engine Oil P03−001, to the hydraulic return adapter (401/7).

(d) Install the hydraulic return adapter (401/7), threads lubricated with Engine Oil P03−001, to the remaining port (right side) of the actuator. Tighten the adapter (401/7) to a snug fit.

(3) Remove protective closures.

(4) Install two hinged clamps to each mount rail on actuator. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the clamps shut if so equipped.

(5) Position and hold actuator clear of pins on bracket on HPC case.

(6) Connect cable end to actuator piston shaft. Position actuator on bracket with pins engaging holes in actuator mount rails.

NOTE: For the complete assembly of the cable and rod, see 72−00−53, Installation−06 (Task 72−00−53−450−004).

(7) Secure actuator in place with four bolts, threads lubricated with Engine Oil P03−001. For engines not equipped with nut plates (Pre SB PW4ENG 75−35), install four nuts. Torque clamp bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(8) Secure ground strap to threaded hole on rear face of actuator with bolt, threads lubricated with Engine Oil P03−001. Torque bolt to 85 − 95 lb−in. (9.604 − 10.734 N.m).

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(9) Lubricate threads of nuts on return (CR13) and pressure (CP11) hoses with Engine Oil P03−001, and attach hoses to their respective ports on actuator.

CAUTION: TO PREVENT OVER TORQUE OF THE ADAPTER AND POSSIBLE DAMAGE TO THE PACKING, HOLD AND KEEP THE ADAPTER FROM TURNING WHEN YOU TORQUE THE HOSE NUT.

(10) With the correct wrench to hold the adapter (401/4) from turning, torque the largest (pressure) hose nut (401/5) (CP11) to 450 − 500 lb−in. (50.843 − 56.492 N.m). Safety the hose nut (401/5) with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: TO PREVENT OVER TORQUE OF THE ADAPTER AND POSSIBLE DAMAGE TO THE PACKING, HOLD AND KEEP THE ADAPTER FROM TURNING WHEN YOU TORQUE THE HOSE NUT.

(11) With the correct wrench to hold the adapter (401/7) from turning, torque the remaining (return) hose nut (401/8) (CR13) to 270 − 300 lb−in. (30.506 − 33.895 N.m). Safety the hose nut (401/8) with Lockwire

P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(12) Lubricate cable coupling nut threads with Engine Oil P03−001, and torque nut to 100 − 125 lb−in. (11.298 − 14.123 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(13) Secure cable rod end bearing to valve idler arm at turbine case cooling (TCC) air shutoff valve (HPT) with bolt, threads lubricated with Engine Oil P03−001, and nut. Torque nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) Connect the W4P16 harness connector to the actuator harness receptacle as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
− The connector coupling nut is fully tight
− The connector fits tightly against the receptacle (metal to metal).

- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Rig automatic turbine rotor clearance control system per 72−00−00, Special Procedures−06 Task 72−00−00−830−004 or Special Procedures−11 Task 72−00−00−830−005 as applicable.

Task 72-00-35-450-003:

1. Install Turbine Vane And Blade Cooling Air Valve Position Switch

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, AS3214-01		

B. Procedure

See Figure 401.

NOTE: This procedure is applicable for engines without SB PW4ENG 72-572 or SB PW4ENG 75-106 or SB PW4ENG 75-756 or SB PW4ENG 75-759 or SB PW4ENG 75-147 only.

(1) Position turbine vane and blade cooling air valve position switch to turbine vane and blade cooling air valve aligning bolt holes for proper positioning. See Figure 401.

(2) Secure position switch to valve with bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) Connect W4P21 the harness connector to the switch as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

CAUTION: USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG TORQUE CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(b) (Reference 2156) Tighten and torque the connector to 30 − 35 lb−in. (3.390 − 3.954 N.m). Install the AS3214−01 Lockwire.

(4) (Reference 760) If necessary, remove the shipping cotter pin and tag from the face of the switch.

(Task 72−00−35−450−003)

Task 72-00-35-450-004:

1. Install Turbine Vane And Blade Cooling Air Valve (Right)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Special Tools:

NOTE: Use a 5/16 inch, 12 point standard torque adapter (approximately 2 9/16 inch (65.088 mm) long) to install and torque the valve attaching bolts.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
R P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-24-00/1/1
Gasket	1	75-24-00/2/95
Gasket	2	75-26-00/2/210

B. Procedure
See Figure 401 and Figure 402.

(1) Remove protective closures.

(2) If a new valve must be installed, do the following:

   (a) Install a new copper gasket to the tube adapter.

   (b) Lubricate the adapter threads with Engine Oil P03-001, and install the adapter to the air supply (servo) port of valve.

   (c) Torque the adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(3) Install a new metal gasket to boss on HPC case located on right side of engine at approximately the 3 o'clock position forward of Flange K and attach with Paraffin Wax P05-059.

CAUTION: WITH A STANDARD TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. (SEE THE STANDARD PRACTICES MANUAL). TOO MUCH TORQUE CAN DAMAGE THE THREADED PARTS.

(4) Install the valve and the bracket to the boss and attach with bolts, thread lubricated with Engine Oil P03-001. Use a 5/6 inch, 12 point standard torque adapter (approximately 2 9/16 inch (65.088 mm) long) to tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.724 N.m), continue to torque the bolts until the torque is kept.

NOTE: If engine has the ring case style compressor, (Post SB PW4ENG 72-756 or SB PW4ENG 72-759), you must install a turbine vane and blade cooling air valve (Post SB PW4ENG 75-147) with the foolproofing pin hole to match the pin on the flange boss, (See Figure 401 (sheet 1) and Figure 402 (Sheet 1).

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket locations on the valve.

(5) Install bolt, threads lubricated with Engine Oil P03-001, nut, and link rod end to bracket attached to valve flange. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(6) FOR THESE MODELS: 4152, 4156A, 4158
Install bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tube clamps to the same bracket. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(7) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube clamp to the same bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) Install a new gasket between the flange of the valve and the turbine vane cooling air tube (AP02) and attach the flanges with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(9) Install a gasket to the four hole air shutoff valve flanged end of the cooling air tube (AP37) and a second gasket to the mating flange on the valve and hold in place with Paraffin Wax P05−059.

(a) FOR THESE MODELS: 4152, 4156A, 4158 (Pre SB PW4ENG 72−572 or SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the metering plate in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(b) FOR THESE MODELS: 4152, 4156A, 4158 (Post PW4ENG 72−572 and Pre SB PW4ENG 72−627 or Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the ring spacer in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 (Pre SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the metering plate in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the ring spacer in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(10) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75−116) Lubricate the threads of the tube adapter with Engine Oil P03−001 and attach the air signal tube (AA21) to the adapter. Torque the tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(11) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−116) Lubricate the threads of the tube adapter with Engine Oil P03−001 and attach the air signal tube (AA90) to the adapter. Torque the tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(12) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Lubricate the threads of the tube adapter with Engine Oil P03−001 and attach the air signal tube (AA77) to the adapter. Torque the tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

C. Postrequisite

(1) FOR THESE MODELS: 4152, 4156A, 4158
Install turbine vane and blade cooling air valve position switch by 72−00−35, Installation−06.

(2) Test engine by Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Figure 402 (Sheet 2)
(Task 72−00−35−450−004)

Task 72-00-35-450-005:

1. Install Turbine Vane And Blade Cooling Air Valve (Left)

A. Equipment And Materials Required

Special Tools:

NOTE: Use a 5/16 inch, 12 point standard torque adapter (approximately 2 9/16 inch (65.088 mm) long) to install and torque the valve attaching bolts.

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Compound, Anti-Gallant

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-24-00/1/1
Gasket	1	75-24-00/3/125
Gasket	2	75-26-00/1/40

B. Procedure
See Figure 401 and Figure 402.

(1) Remove protective closures.

(2) If new valve is being installed, comply with the following:

(a) With gasket on tube adapter and with threads lubricated with Engine Oil P03-001, install to air supply (servo) port of valve.

(b) Tighten and torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m)

(3) Install new metal gasket to pad on HPC case located in upper left side of engine at 10 o'clock position forward of Flange K and secure with Paraffin Wax P05−059.

CAUTION: WITH A STANDARD TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. (SEE THE STANDARD PRACTICES MANUAL). TOO MUCH TORQUE CAN DAMAGE THE THREADED PARTS.

(4) Position valve and bracket to above pad and secure with bolts, thread lubricated with Engine Oil P03−001. Use a 5/6 inch, 12 point standard torque adapter (approximately 2 9/16 inch (65.088 mm) long) to tighten and torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Then without loosening, continue to tighten to required torque until torque is maintained.

NOTE: If engine has the ring case style compressor (Post SB PW4ENG 72−756 or SB PW4ENG 72−759), you must install a turbine vane and blade cooling air valve (Post SB PW4ENG 75−147) with the foolproofing pin hole to match the pin on the flange boss (Figure 401 and Figure 402).

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket locations on the valve.

(5) Install bolt, threads lubricated with Engine Oil P03−001, and nut securing tube clamp to bracket mounted to flange of valve. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) Position new metal gasket between flanges of subject valve and vane cooling air tube (AP04) and secure flanges with bolts, threads lubricated with Engine Oil P03−001. Tighten and torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), then without loosening, continue to tighten to required torque until torque is maintained.

(7) Install a gasket to the four hole air shutoff valve flanged end of the cooling air tube (AP38) and a second gasket to the mating flange on the valve and hold in place with Paraffin Wax P05−059.

(a) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−572 or SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the metering plate in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(b) FOR THESE MODELS: 4152, 4156A, 4158
(Post PW4ENG 72−572 and Pre SB PW4ENG 72−627 or Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the ring spacer in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Pre SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the metering plate in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the ring spacer in the four hole air shutoff valve flanged end of the tube (between the gaskets) and hold in place with Paraffin Wax P05−059. Attach the flange of the tube to the valve with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m), continue to torque the bolts until the torque is kept.

(8) Lubricate outer threads of tube adapter with Anti−Gallant compound P06−021, and secure air signal tube (AA19) nut to "servo" port. Tighten and torque tube nut 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

C. Postrequisite

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-35-450-006:

1. Install HPC Secondary Flow Control Valve (Left)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-059	Wax, Paraffin (PMC 9552)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P06-054	Paste, Anti-Seize (PWA 36246)
	P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-33-00/1/1
Lockwire, AS3214-01		

B. Procedure
See Figure 401.

NOTE: This procedure is applicable for engines without SB PW4ENG 72-572 or SB PW4ENG 75-106 only.

(1) If new valve is to be installed, comply with the following:

(a) With valve on bench and viewed as in Figure 401, remove protective closures from valve ports. Install gasket on plug. Install plug, threads lubricated with Engine Oil P03-001, into lower outboard port of valve. Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(b) Install three hole cover, with air vent holes (towards valve flange and towards valve port) to rear port. Secure cover and bracket (Post SB PW4ENG 72-211 only) with three bolts, lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Install plain three hole cover to remaining three hole port. Secure cover with three bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(d) Install gasket on adapter. Install adapter, threads lubricated with Engine Oil P03-001, into remaining threaded valve port. Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(e) (Pre SB PW4ENG 75-85), Lubricate the threads of the adapter with Engine Oil P03-001. Install a cap assembly onto the adapter and torque the cap assembly to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install lockwire on the cap assembly.

NOTE: HPC air valve signal tube was removed and cap assemblies installed on the air filter and the HPC air valve by Alert SB PW4ENG 75-62R2.

NOTE: HPC air valve signal tube was reinstalled and the cap assemblies were removed from the air filter and the HPC air valve by SB PW4ENG 75-85.

(2) Remove protective closures. Install gasket on HPC case pad. Secure gasket in place with Paraffin Wax P05-059.

(3) Install valve on pad aligning offset hole. Secure valve with six bolts, threads lubricated with Engine Oil P03-001. Tighten bolts to a torque of 85 - 95 lb-in. (9.604 - 10.734 N.m), then retorque to same torque without loosening.

(4) (Post SB PW4ENG 75-85), Install the HPC air valve signal tube assembly (AA16) on the left side of the engine.

R (a) Remove the protective covers and lubricate the tube nut threads with Anti-Seize Paste P06-054.
R Remove the unwanted paste. Install the tube
R to the rear of the lower left air filter at approximately the 11 o'clock position and to the HPC secondary flow control valve approximately at the 10 o'clock position.

(b) Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(5) Connect the W5P10 harness connector to the valve as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

CAUTION: USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG TORQUE CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(b) (Reference 2154) Tighten and torque connector to 21 - 26 lb-in. (2.373 - 2.938 N.m) and secure with AS3214-01 Lockwire.

(6) For engines with the bracket on the rear of the valve, attach the tube clamp with the bolt, lubricated with Engine Oil P03-001, and nut (Post SB PW4ENG 72-211 only). Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-33-00/1/1

B. Procedure
See Figure 401.

NOTE: This procedure is applicable for engines without SB PW4ENG 75-106 or SB PW4ENG 72-572 only.

(1) If new valve is to be installed, comply with the following:

(a) With valve on bench and viewed as in Figure 401, remove protective closures from valve ports. Install new gasket on plug. Install plug, threads lubricated with Engine Oil P03-001, into upper outboard port of valve. Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(b) Install three hole cover, with air vent holes away from operator and towards valve, to rear port. Secure cover with three bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(c) Install plain three hole cover to remaining three hole port. Secure cover with three bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(d) Install gasket on adapter. Install adapter, threads lubricated with Engine Oil P03-001, into remaining threaded valve port. Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(e) (Pre SB PW4ENG 75-85) Lubricate the threads of the adapter with Engine Oil P03-001. Install a cap assembly onto the adapter and torque the cap assembly to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the cap assembly.

NOTE: The HPC air valve signal tube (AA15) was removed and cap assemblies installed on the air filter and the HPC air valve by Alert SB PW4ENG 75-62R2.

NOTE: The HPC air valve signal tube (AA15) was reinstalled and the cap assemblies were removed from the air filter and the HPC air valve by SB PW4ENG 75-85.

(2) Remove protective closures. Install gasket on HPC case pad. Secure gasket in place with Paraffin Wax P05-059.

(3) Install valve on pad aligning offset hole.

(a) (Post SB PW4ENG 73-163) Align the bracket with the 6 and 8 o'clock holes. Install the washers between the bracket and the valve.

(b) Secure valve with six bolts, threads lubricated with Engine Oil P03-001. Tighten bolts to a torque of 85 - 95 lb-in. (9.604 - 10.734 N.m), then retorque to required torque without loosening.

(4) (Post SB PW4ENG 75-85 and Pre SB PW4ENG 75-116) Install the HPC air valve signal tube assembly (AA15) on the right side of the engine.

(a) Remove the protection covers and lubricate the tube nut threads with Engine Oil P03-001. Install the tube to the rear of the lower right air filter at approximately the 2 o'clock position and to the HPC secondary flow control valve at approximately the 3:30 o'clock position forward of Flange J.

(b) Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(5) (Post SB PW4ENG 75-116) Install the HPC air valve signal tube assembly (AA91) on the right side of the engine.

(a) Remove the protection covers. Install the tube to the (AA89) tube tee at approximately the 2;30 o'clock position forward of Flange J. Install the lower end of the tube to the HPC secondary flow valve at approximately the 3:30 o'clock position forward of Flange J.

(b) Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attach the tube to a bracket that is attached to the turbine cooling air shutoff valve flange. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(6) Connect W4P10 the harness connector to the valve as follows.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

CAUTION: USE THE CORRECT ASSEMBLY TORQUE. USE OF THE WRONG TORQUE CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(b) (Reference 2154) Tighten and torque connector to 21 − 26 lb−in. (2.373 − 2.938 N.m) and secure. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the connector.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Figure 401
(Task 72-00-35-450-007)

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-11

Task 72-00-35-450-008:

1. Install Fuel/Oil Cooler Bypass Valve

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	79-21-00/6/1
Packing	2	79-21-00/6/200
Packing	1	79-21-00/6/220
Packing	1	79-21-00/6/250

B. Procedure
See Figure 401.

(1) Remove protective closures from fuel/oil cooler bypass valve (401/13).

(2) If new bypass valve assembly is being installed, install adapters and plugs as follows:

(a) Install new packing (401/3), lubricated with Engine Oil P03-001, to adapter (401/4) and install adapter threads lubricated with Engine Oil P03-001, to port (marked RTN). Torque the adapter 110 - 120 lb-in. (12.428 - 13.558 N.m).

(b) Install new packing (401/12) lubricated with Engine Oil P03-001, to adapter (401/11) and install adapter, threads lubricated with Engine Oil P03-001, to the port (marked IDG OIL). Torque the adapter 375 - 425 lb-in. (42.369 - 48.019 N.m).

(c) Install new packing (401/5), lubricated with Engine Oil P03−001, to adapter (401/6) and install adapter, threads lubricated with Engine Oil P03−001, to the valve opening (marked ENG OIL). Torque the adapter to 650 − 750 lb−in. (73.440 − 84.739 N.m).

(d) Install new packing (401/7) lubricated with Engine Oil P03−001, to plug (401/8) and install plug, threads lubricated with Engine Oil P03−001, to small port (marked DRN). Torque plug 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the plug.

(3) Position gasket (401/2) to bypass valve (401/13) and position valve to fuel/oil cooler (401/1) and secure with eight bolts (401/10), threads lubricated with Engine Oil P03−001 and washers (401/9). Torque bolts 85 − 95 lb−in. (9.604 − 10.734 N.m).

C. Postrequisites

(1) Install fuel/oil cooler. See Installation−04 Task 72−00−35−450−001−A00.

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72-00-35-450-009:

1. Install 9th Stage Start/Stability (2.9) Bleed Valve (Upper Left)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:
PWA 85436 Adapter, Torque

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Compound, Antigalling (PWA 550-3)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	75-35-00	1	1
Gasket	1	75-35-00	1	40

B. Procedure
See Figure 401.

(1) Install gasket (401/2) on adapter (401/1). Lubricate adapter threads with Engine Oil (P03-001).

(2) Remove protective closure and install adapter (401/1) in boss on bleed valve (401/5). Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(3) If equipped remove the protection cover from the boss on the side of the bleed valve. Install the cover (401/8) to the boss and attach the bolts (401/7), threads lubricated with Engine Oil (P03-001). Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(4) Remove protective closure from boss on left side of HPC case at approximately 10 o'clock position and install gasket (401/3) in groove on boss.

CAUTION: WHEN USING PWA 85436 TORQUE ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT

Ninth Stage Start/Stability (2.9)
Bleed Valve Installation
Figure 401
(Task 72-00-35-450-009)

STATED BELOW. SEE STANDARD TORQUES IN STANDARD PRACTICES MANUAL.

(5) Remove protective closure from bleed valve (401/5) and install valve to boss aligning adapter (401/1) with tube nut (401/6). Secure bleed valve with eight bolts (401/4), lubricated with Engine Oil (P03−001). Using PWA 85436 Torque Adapter tighten and torque bolts (401/4) to 85 − 95 lb−in. (9.604 − 10.734 N.m) then restore to required limit without loosening until required torque is maintained.

(6) Connect tube nut (AA30) (401/6) threads lubricated with Antigalling Compound (P06−021), to adapter (401/1) on bleed valve. Torque to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-35-450-010:

1. Install 9th Stage Start/Stability (2.9) Bleed Valve (Upper Right)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85436 Adapter, Torque

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	75-35-00	1	1
Gasket	1	75-35-00	1	40

B. Procedure
See Figure 401.

(1) Install gasket (401/5) on adapter (401/6). Lubricate adapter threads with Engine Oil (P03-001).

(2) Remove protective closure and install adapter (401/6) in boss on bleed valve (401/1). Torque adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(3) If equipped remove the protection cover from the boss on the side of the bleed valve. Install the cover (401/8) to the boss and attach the bolts (401/9), threads lubricated with Engine Oil (P03-001). Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(4) Remove protective closure from boss on right side of HPC case at approximately 1 o'clock position and install gasket (401/4) in groove on boss.

CAUTION: WHEN USING PWA 85436 TORQUE ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT

Ninth Stage Start/Stability (2.9)
Bleed Valve Installation (Upper Right)
Figure 401
(Task 75−00−35−450−010)

STATED BELOW. SEE STANDARD TORQUES IN STANDARD PRACTICES MANUAL.

(5) Remove protective closure from bleed valve (401/1) and install valve to boss aligning adapter (401/6) with tube nut (AA28) (401/7). Secure bleed valve with eight bolts (401/2), lubricated with Engine Oil (P03−001) and bracket (401/3). Using PWA 85436 Torque Adapter tighten and torque bolts (401/2) to 85 − 95 lb−in. (9.604 − 10.734 N.m) then restore to required limit without loosening until required torque is maintained.

(6) Connect tube nut (AA28) (401/7) threads lubricated with Engine Oil (P03−001), to adapter (401/6) on bleed valve. Torque to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

C. Postrequisites

(1) For engines with the 2.9 bleed valve thermocouple probe, install the probe. See 72−00−35, Installation−17 (Task 72−00−35−450−014).

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Previous Pageblock   Return to Previous Menu   Next Pageblock

Task 72-00-35-450-011:

1. Install Engine Fuel/Oil Cooler Bypass Valve Solenoid

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	3	79-21-00/6/14

B. Procedure

See Figure 401.

R R R (1) Install the three packings (401/5) lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the fuel/oil cooler bypass valve solenoid (401/2).

(2) Install solenoid (401/2) to rear end of bypass valve (401/1), with electrical connectors facing downward, and secure with screws (401/3), threads lubricated with Engine Oil P03-001 and washers (401/4). Torque screws to 60 - 80 lb-in. (6.779 - 9.039 N.m).

(3) Connect the W5P5 and the W3P5 harness connectors to the solenoid front and rear, respectively, harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight all the bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70-21-00-110-900). Refer to Section 70-21-00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal)
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque. See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Figure 401
(Task 72-00-35-450-011)

Task 72-00-35-450-012:

1. Install Variable Stator Vane Actuator

A. Equipment And Materials Required

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-005	Lubricant (PWA 587)
	P06-037	Compound, Anti-seize (PWA 36053-4)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	2	75-31-00/1/100
Key Washer	1	75-31-00/1/120
Packing	1	75-31-00/1/10
Packing	1	75-31-00/1/30

B. Procedure

See Figure 401.

(1) If new actuator (401/18) is being installed comply with the following:

R (a) Install the new packings (401/13) and (401/14),
R lubricated with Engine Oil P03-001 or Sealing Ring
R Lubricant P06-053 on the adapters (401/12) and
R (401/15). Remove the protective closures from actuator ports and install adapters, threads lubricated with Engine Oil P03-001. Torque smaller adapter at return port to 110 - 120 lb-in. (12.428 - 13.558 N.m). Torque larger adapter at pressure port to 150 - 170 lb-in. (16.948 - 19.207 N.m). Install the Lockwire P05-289 or

Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(b) Install nut (401/17), new key washer (401/19) and rod end bearing (401/24) to actuator (401/18). Do not tighten nut or bend keywasher.

(2) Position actuator (401/18) to support bracket (401/5) with rod end bearing (401/24) up through hole in support bracket. Align side mount holes in actuator with openings in support bracket. Apply Lubricant P06-005 or Anti-seize Compound P06-037 to the bearing pins (401/4) and insert pins through support brackets bearings to engage the actuator. Tap to seat. Install bearing stops (401/7) to bracket aligning bolt hole in stop with hole in bracket. Secure stops with bolts (401/3), threads lubricated with Engine Oil P03-001, washers (401/25) (SB PW4ENG 72-498) and nuts (401/2). Torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install cotter pins (401/1) and bend to lock. See Standard Practices Manual.

NOTE: With some tolerance conditions, the clearance between the bolt hole in the bearing stop (401/7) and the bolt (401/3) possibly is not sufficient for a satisfactory installation of the bolt. If this occurs, see SB PW4ENG 75-38 for the repair procedure.

(3) Secure rod end bearing (401/24) to compressor stator bellcrank with shoulder bolt (401/23), threads lubricated with Engine Oil P03-001, washer (401/22) and nut (401/20), fingertight only.

(4) Secure ground cable (401/11) to actuator (401/18) with bolt, threads lubricated with Engine Oil P03-001. Torque bolt to 75 - 85 lb-in. (8.474 - 9.604 N.m).

(5) Connect the W4P3 and the W5P7 harness connectors to the actuator harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight any bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70-21-00-110-900). Refer to Section 70-21-00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

NOTE: Hydraulic pressure and return tubes will be torqued during rigging procedure.

C. Postrequisites

(1) Rig variable stator vane actuator per 72−00−00, Special Procedures−05 Task 72−00−00−830−003.

Variable Stator Vane Actuator Installation
Figure 401
(Task 72-00-35-450-012)

Task 72-00-35-450-013:

1. Install PS3 Air Filters

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-021	Compound, Antigalling (PWA 550-3)
R	P06-054	Paste, Antiseize (PWA 36246)

B. Procedure
See Figure 401, Figure 402 and Figure 403.

(1) Remove protective closures.

(2) Position the air filters to holes in the Flange J brackets at approximately the 11 and 1:30 o'clock positions. Attach with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) FOR THESE MODELS: 4152, 4156A, 4158
R Install tube nuts, threads lubricated with Antiseize
R Paste P06-054, to filters. Wipe off unwanted paste. Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the forward tube nuts to the forward hex adapters. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the rear tube nuts to the filter covers.

(4) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install tubes (AA06), (AA76), (AA18) and (AA19) to the filters at approximately the 11 o'clock position with tube nut threads lubricated with Antigalling Compound P06-021. Torque the tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292

from the forward tubes to the forward hex adapters. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 from the rear tubes to the filter covers. See Figure 403 (Sheet 1).

(5) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install tubes (AA77), (AA01), (AA23) and (AA24) to the filters at approximately the 1:30 o'clock position with tube nut threads lubricated with Antigalling Compound P06−021. Torque the tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 from the forward tubes to the forward hex adapters. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 from the rear tubes to the filter covers. See Figure 403 (Sheet 2).

(6) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75−85), Install the cap assembles, threads lubricated with Engine Oil P03−001, to the filters. Torque the cap assemblies to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the cap assemblies.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
HPC air valve signal tube was removed and cap assemblies installed on the air filter and the HPC air valve by Alert SB (PW4ENG 75−62R2).

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
HPC air valve signal tube was re−installed and the cap assemblies were removed from the air filter and the HPC air valve by SB (PW4ENG 75−85).

Task 72-00-35-450-014:

1. Install The 9th Stage Start/Stability (2.9) Bleed Valve Thermocouple

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure
See Figure 401 and Figure 402.

NOTE: Use this procedure for the installation of either the left, right, or both of the thermocouple probes.

(1) Remove the protection covers.

(2) Install the thermocouple probe and bracket to the port in the bleed valve as shown in the figure. Attach the bracket and probe with the two bolts, lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) Install the harness to the thermocouple probe with the two nuts. Tighten by hand.

(4) Lubricate the welded bolt on the bracket with Engine Oil P03-001. Install the small ground cable and clamp and attach them to the bolt with a clamp nut. Torque the clamp nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(5) (Reference 2273) Torque the nut on the larger stud of probe to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(6) (Reference 2273) Torque the nut on the smaller stud on probe to 15 - 18 lb-in. (1.695 - 2.034 N.m).

Task 72-00-35-430-001:

1. Install The Upper Half Of The HPC Front Case After Accessing The 5th Through 8th Stage Blades

A. Prerequisites

(1) If removed, install the 5th through 8th stage blades. See Installation-19 Task 72-00-35-430-002.

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 86564	Sling - HPC Front Split Case

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
	P05-395	Beeswax
	P05-396	Paraffin Wax Blend
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	8	72-35-00/12/280
Key Washer	8	72-35-00/13/280
Key Washer	8	72-35-00/14/280
Key Washer	8	72-35-00/15/280
Packing	A/R	72-35-00/11/170

C. Procedure

(1) Install the top HPC front case as follows:

(a) Install new packing material into the groove on the rear flange of the top HPC front case. Hold in place with small amounts of Beeswax P05-395 or Paraffin Wax Blend P05-396. The ends of the packing material must be even or below the case split line.

(b) Install PWA 86564 Sling to top half of HPC front case. Attach hoist and carefully install the case to the HPC. Remove sling.

(c) (Reference 1553) Attach the top case as follows:

1 Install the 22 bolts, lubricated with Engine Oil P03-001, and 22 nuts that attach the top case to the lower case.

NOTE: Tighten the bolts by hand.

2 Install the Flange H hardware as follows: Refer to 72-35-00 Assembly-21 (Task 72-35-00-430-021).

NOTE: Tighten the bolts by hand.

3 Tighten and torque the horizontal flanges to 565 - 595 lb-in. (63.836 - 67.226 N.m). Tighten these bolts in order per Figure 401.

(d) Tighten and torque the Flange H bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

CAUTION: FIFTH AND SIXTH STAGE SYNCHRONIZING RING CLEVISES AND 7TH STAGE SYNCHRONIZING RING MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR (19 STATOR VANE SCHEDULE (SB PW4ENG 72-197)

(2) Connect the upper and lower HPC synchronizing rings to each other as follows: See Figure 402.

(a) Install the clevis and plate to each stage.

NOTE: Do not intermix synchronizing plates and synchronizing rings. Make sure the correct synchronizing plate is used with the correct synchronizing ring.

(b) Attach each plate and clevis with to each stage with eight key washers and eight bolts, lubricated with Engine Oil P03−001.

NOTE: Turn the synchronizing rings as necessary to gain access to the clevis and plate bolts and key washers.

(c) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend the key washer tubes to secure the bolts.

(3) Install the tubes to the top right side of the engine as follows. See Figure 403.

(a) Install the (left) bleed valve supply tube (AA30) as follows.

1 Remove the protection covers.

R R 2 Lubricate the tube threads with Antiseize Paste P06−054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the rear tube nut to 200 − 225 lb−in. (22.597 − 23.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(b) Install the (right) bleed valve supply tube (AA28) as follows.

1 Remove the protection cover.

R R 2 Lubricate the tube threads with Antiseize Paste P06−054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the rear tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(c) Install the HPC air valve and bleed valve supply manifold (AA24) as follows.

1 Remove the protection covers.

R R 2 Lubricate the tube threads with Antiseize Paste P06−054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the rear tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Install the HPC air valve signal tube (AA01) as follows.

1 Remove the protection covers.

R R 2 Lubricate the tube threads with Antiseize Paste P06−054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the rear tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Install the HPC air valve supply tube (AA25) as follows.

1 Remove the protection covers.

R 2 Lubricate the tube threads with Antiseize Paste
R P06−054. Wipe off unwanted paste.

3 Install the tube, forward end to nipple on TVBC solenoid and aft end to AA34.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the rear tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

CAUTION: DO NOT LUBRICATE EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(f) Install the EEC PB tube (AS09) as follows.

1 Remove protection covers.

2 Install the tube and tighten by hand.

3 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Torque the rear tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(4) Install the tubes to the top left side of the engine as follows. See Figure 404.

CAUTION: DO NOT LUBRICATE EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(a) For engines without the PT4.95 maintenance break at Flange K (Pre SB PW4ENG 73−106), install the EEC PT4.95 tube (AS01) as follows.

1 Remove the protection covers.

2 Install the tube and tighten by hand.

3 Install the clamps, bolts, lubricated with Engine Oil P03−001, spacer, and nuts. Torque the clamps bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Torque the rear tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(b) For engines with the PT4.95 maintenance break at Flange K (Post SB PW4ENG 73−106), install the EEC PT4.95 tube (AS41) as foll

1 Remove the protection covers.

2 Install the tube and tighten by hand.

3 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamps bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

4 Torque the rear tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(c) Install the HPC (left) air valve signal tube (AA06) as follows.

1 Remove the protection covers.

R 2 Lubricate the tube threads with Antiseize Paste
R P06−054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

5 Torque the forward tube nut, attaching the solenoid adapter, and the rear tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Install the air shutoff valve signal tube (AA18) as follows.

1 Remove protection covers.

R 2 Lubricate the tube nut threads with Antiseize
R Paste P06-054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03-001, spacer, and nuts. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

5 Torque the forward tube nut, attaching to the solenoid adapter, the rear tube nut attaching to the air filter to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(e) Install the HPC air valve and air shutoff valve supply tube (AA22) as follows.

1 Remove the protection covers.

R 2 Lubricate the tube threads with Antiseize Paste
R P06-054. Wipe off unwanted paste.

3 Install the tube and tighten by hand.

4 Install the clamps, bolts, lubricated with Engine Oil P03-001, spacer, and nuts. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

5 Torque the rear tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

D. Postrequisites

(1) Install the fan-unit to the core engine. See 72-00-34, Installation-21 (Task 72-00-34-420-004).

(Task 72−00−35−430−001)

Task 72-00-35-430-002:

1. Install The 5th Through 8th Stage HPC Blades (Quick HPC Blade Change)

A. Prerequisites

(1) Remove damaged 5th through 8th stage HPC blades. Refer to Removal−19 Task 72−00−35−030−002.

B. Equipment And Materials Required

Standard Tools:

Computer Program "BLADIS"

NOTE: The computer program (for the personal computer) is available from: Schenck Trebel Co., 535 Acorn St.,Deerpark, NY 11729

Special Tools:

PWA 78012	Bender, Pneumatic (Optional To PWA 100012 Change Letter A and PWA 102146)
PWA 78013	Bender, Pneumatic (Optional To PWA 100013)(Replaced By PWA 100014 Change Letter A)
PWA 78014	Bender, Pneumatic (Replaced By PWA 100013 Change Letter B)
PWA 86518	Bender, Mechanical (Optional To PWA 78012)
PWA 86519	Bender, Mechanical (Optional To PWA 78013)
PWA 86520	Bender, Mechanical (Optional To PWA 78014)
PWA 87123	Bender, Mechanical (Optional To PWA 86520)
PWA 87128	Bender, Mechanical (Optional To PWA 86518)
PWA 87129	Bender, Mechanical (Optional To PWA 86519)
PWA 100012	Bender Change Letter A, Pneumatic (Prebend) (With PWA 102146, Optional to PWA 78012)
PWA 100013	Bender Change Letter B, Pneumatic (Initial Bend) (Replaces PWA 78014 And Options)
PWA 100014	Bender Change Letter A, Pneumatic (Initial Bend) (Replaces PWA 78013 And Options)
PWA 100096	Bender, Pneumatic (Final Bend)
PWA 102146	Bender, Pneumatic (Final Bend) (With PWA 100012 Change Letter A, Optional to PWA 78012)
PWA 102171	Bender, Pneumatic (Final Bend)

Consumable Materials:

Item No.	Designation
P05-045	Pen, Marker
P09-014	Sealant, Silicone Rubber (PWA 36003)
P09-015	Sealing Compound (PWA 544)

C. Procedure

(1) Ensure that the protector is secured to prevent foreign material from falling into the engine.

CAUTION: SIXTH THROUGH EIGHTH STAGE BLADES THAT DO NOT HAVE EROSION OR MATERIAL REMOVAL BY BLENDING CAN BE REPLACED AS SINGLE (UNPAIRED) BLADES OF THE SAME PART NUMBER AS SPECIFIED IN TABLE 401. BLADES THAT ARE ERODED OR WERE PREVIOUSLY BLENDED MUST BE REPLACED IN BLADE PAIRS AS SPECIFIED IN TABLE 401.

(2) Obtain the blades to be replaced. Refer to Table 401 for the blade replacement guidelines. If the following blade replacement guidelines do not apply, then replace blades in order by computer program.

Blade Replacement Guidelines	Stage 5	Stage 6	Stage 7	Stage 8
Maximum number of unpaired blades (Original blades must not be eroded, blended, etc.)	0	2	4	4
or				
Maximum number of pairs of blades	6	8	10	10

Blade Replacement Limits
Table 401

(3) Mass weigh blades. Blade weight pairs must be within 0.025 oz. (709. mg). Temporarily mark the blade weight with a Marker P05-045 or equivalent.

(4) If a complete set of blades must be installed, pan weigh the blades to within 0.025 oz. (709. mg). Temporally mark the blade weight with a Marker P05-045 or equivalent. Use the computer program "Bladis" to determine the blade installation sequence to produce a net vector sum of 0.1 oz-in. (72. g.mm) or less.

(5) Wipe blade areas to be sealed by SPOP 208 Wipe Method (Task 70-21-00-110-040).

(6) For the 5th stage blades, you must reinstall the correct counterweights to the blades that will be installed at the counterweight locations identified in 72-00-35, Removal-19 (Task 72-00-35-030-002) as follows:

(a) Apply Silicone Rubber Sealant P09-014 to the counterweight as shown in Figure 401.

(b) Place counterweight with sealant to the bottom of the blade root.

(7) Immediately before installing each 5th or 6th stage blade, apply Silicone Rubber Sealant P09-014 to the blade root as shown in Figure 402. Coat blades thickly enough to fill in voids between blade root and disk/drum slot when blade is in the installed position. Also, apply sealant to the wire lock groove of blades and of disk/drum at blade locations. See Figure 402.

(8) Assemble each 5th or 6th stage blade into the disk as follows:

(a) For the 5th stage blades, use the reference marks on the disk to locate where to install the blades with the counterweights.

(b) When a blade is assembled into the disk/drum, hold the blade radially outward against the disk slot bearing surface, while the blade is moved to the installed position.

(c) Remove excess sealant from around the blade root area and fill in any voids.

NOTE: If disassembly is required and the sealant coating is damaged, it must be repaired before reassembly.

R (9) Retain the 5th stage blades by inserting the wire locks into the wire lock grooves in a clockwise direction when viewed from the front. Be sure the lock under the blade is coated with sealant to make sure lock will not roll over after sealant cure. Use the PWA 78012 Pneumatic Bender or the PWA 86518 Mechanical Bender or PWA 87128 Mechanical Bender to crimp the wire locks for blades. These bending tools have separate jaws for initial and final bends. After making the initial bend, replace the initial bend jaw with the final bend jaw and compress handles until blade lock is fully bent. As an option to the PWA 78012 Pneumatic Bender with separate jaws for initial and final bends, the PWA 100012 Pneumatic Bending Tool Change Letter A is used for the prebend of the blade lock and the PWA 102146 Pneumatic Bending Tool is used for the final bend of the blade lock. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 403. R

R (10) Retain the 6th stage blades by inserting the wire locks into the wire lock grooves in a clockwise direction when viewed from the front. Be sure the lock under the blade is coated with sealant to make sure lock will not roll over after sealant cure. Bend the blade locks. Use a PWA 78013 Bender or a PWA 100014 Pneumatic Bender Change Letter A for the initial bend and a PWA 100096 Pneumatic Bender for the final bend to crimp the locks. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 403. R

NOTE: If you use the PWA 78013 Bender, you must use the pre bend and final bend jaws.

R (11) Allow sealant to cure at room temperature and 20 percent minimum humidity for eight hours prior to the balance operation. Total curing time before engine test is 24 hours minimum.

R (12) For 7th and 8th stage blades that are replaced, apply R Sealing Compound P09-015 to the areas shown in Figure R 404, after cleaning those areas as specified in step (5). If sealant is not applied immediately after cleaning, exercise extreme care to protect prepared surfaces against contamination with oil, grease or other foreign materials.

R (13) Assemble blades into drum as described in step (7).

R (14) Retain 7th and 8th stage blades by inserting the wire locks into the wire lock grooves in a clockwise direction when viewed from the front. Bend the blade locks. Use a PWA 78014 Bender or a PWA 100013 Pneumatic Bender Change Letter B for the initial bend and a PWA 102171 Pneumatic Bender for the final bend to crimp the locks. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 403. R

NOTE: If you use the PWA 78014 Bender, you must use the pre bend and final bend jaws.

D. Postrequisites

(1) Install the upper half of the HPC front case after accessing the 5th through 8th stage blades. Refer to Installation-18 Task 72-00-35-430-001.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSTALLATION-20

Task 72-00-35-450-015:

1. Install The (2.9) Bleed Valve Screen

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 401.

      (1) Remove the protective cover from the bleed valve port.

      (2) Position the screen on the bleed valve housing and secure it at the flange with four screws. Torque the screws to 32 - 36 lb-in. (3.616 - 4.007 N.m).

      (3) Attach the screen to the bleed valve housing through the opening in the center of the screen mesh with a screw an washer. Torque the screw to 25 - 30 lb-in. (2.825 - 3.390 N.m).

Task 72-00-35-450-016:

1. Install Turbine Vane Cooling Air Valve

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
	P05-059	Wax, Paraffin (PMC 9552)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket, ST2402-030 or ST2412-030	1	
Gasket, ST1112-029 or ST1122-029	1	
Gasket, 512640	1	

B. Procedure
See Figure 401.

(1) Remove protection covers.

(2) If a new valve is being installed, do the following.

(a) Install a gasket to the tube adapter.

(b) Lubricate the threads of the adapter with Engine Oil P03-001, and install the adapter in the air supply port of the valve.

(c) Torque the adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(3) Install a new gasket to the boss on the HPC case located on the right side of the engine at approximately the 2:30 o'clock position. Attach the gasket to the case with Paraffin Wax P05-059.

(4) Install a new gasket to the flange of the (upper) right turbine vane cooling air duct (AP01). Attach the gasket with Paraffin Wax P05-059.

(5) Install the valve with a bracket to the boss and attach with bolts, threads lubricated with Engine Oil P03-001 Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Without loosening the bolts, torque the bolts again until the 85 - 95 lb-in. (9.604 - 10.734 N.m) is keep.

(6) Attach the flange of the (upper right) turbine vane cooling air duct (AP01) to the flange of the valve with bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Without loosening the bolts, torque the bolts again until the 85 - 95 lb-in. (9.604 - 10.734 N.m) is keep.

(7) Install the link rod end to the bracket that is mounted to valve flange. Attach the rod end to the bracket with a bolt, threads lubricated with Engine Oil P03-001 and a nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

R
R
R
(8) Lubricate the threads of the tube adapter with Antiseize Paste P06-054. Remove the unwanted paste and attach the air signal tube (AA76) to the adapter. Torque the tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the tube nut.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-01

Task 72-00-35-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(-)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(-)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-02

Task 72-00-35-210-001:

1. Inspect Variable Stator Vane Control System
   - A. Equipment And Materials Required - None
   - B. Procedure
     - (1) Inspect variable stator vane actuator for leakage. Any leakage requires replacement of actuator. See Removal-15 (Task 72-00-35-050-012) and Installation-15 (Task 72-00-35-450-012).
     - (2) Inspect actuation linkage for damage and/or looseness.
       - (a) Any damage requires replacement of part(s).
       - (b) No end play is permitted in spherical rod end bearing and if present, part(s) must be replaced.
     - (3) Inspect stator vane arms and retaining pins for proper attachment or to locate loose or detached vane arms in Stages IGV, 5, 6 or 7. See 72-00-35, Inspection/Check-03 (Task 72-00-35-210-002) for inspection procedure.
     - (4) If any part(s) are replaced per this inspection procedure, cycle stator vane control system several times with 250 - 350 psig (1723.7 - 2413.2 kPa) hydraulic pressure applied to ensure freedom of movement and no binding.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL − HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−03

Task 72−00−35−210−002:

1. Inspect HPC Secondary Flow Control Valve System
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figures 801 and 802.
     - (1) Inspect HPC secondary flow control valve and HPC secondary flow control valve, turbine vane and blade cooling air valve solenoid for physical condition and security.
     - (2) Check HPC secondary flow control valve visual position indicator pin.

       NOTE: Valves are spring−loaded open when deactivated.

       - (a) An extended pin indicates valve is fully open (normal condition).
       - (b) If pin is not fully extended, valve may be partially or fully closed. Replace valve.
     - (3) Inspect plumbing and brackets for physical condition and security.
       - (a) Cracked or crimped tubes are not acceptable and must be replaced.
       - (b) Minor surface damage is acceptable provided the function of the system is not compromised.
     - (4) Inspect electrical harnesses for chafing and/or loose connectors. Replace as required.
     - (5) Visually inspect the HPC variable stator vane system for Stages IGV, 5, 6 and 7. See Figure 803 (Sheets 1 and 2).
       - (a) Inspect the HPC synchronizing unison ring rivet pin assemblies for lateral or radial looseness of pin heads that can result in interference/binding with the vespel runner pads. If pin looseness is found, replace unison ring assembly.

         NOTE: If the inspection results confirm that no rivet pins are loose, the following inspection step need not be performed.

       - (b) Inspect the vespel runner pads at 20 locations on the upper half of the HPC front case assembly. Look for possible chipping or grooving caused by interference with loose unison ring assembly rivet pins. If damaged runner pads are found, perform a detail borescope inspection for HPC rotor blade Stages 5, 6 and 7, prior to engine operation. Refer to 72−00−00, Inspection/Check−01. Remove/ replace damaged runner pads.

(c) Inspect variable vane actuation linkage for damage or looseness. No wear or end play is permitted in the spherical rod end bearings in the connecting rods between lever sets and VSV synchronizing rings. If damage or looseness is present, the damaged or worn part(s) must be replaced.

(d) Inspect variable vane arms to locate loose or detached vane arms in Stages IGV, 5, 6 and 7. Any loose vane arms require that the synchronizing ring for the stage be replaced. However, any detached vane arms that are found require disassembly of the HPC and inspection of rotor disks, blades and vanes as specified below. Vane arm detachment is defined as a loss of rivet pin attachment to the synchronizing ring, incorrect assembly to the vane trunnion or detachment from the vane trunnion. If distress/crack indication is found in any vanes or blades, replace all the vanes or blades in the subject stage. See Figure 804.

1 A detached inlet guide vane (IGV) arm requires that rotor disks, blades and vanes in Stages IGV, 5th and 6th be completely inspected for crack indication

2 A detached 5th stage vane arm requires that rotor disks, blades and vanes in Stages 5th, 6th and 7th be completely inspected for crack indication.

3 A detached 6th stage vane arm requires that rotor disks, blades and vanes in Stages 6th, 7th and 8th be completely inspected for crack indication.

4 A detached 7th stage vane arm requires that rotor disks, blades and vanes in Stages 7th, 8th and 9th be completely inspected for crack indication.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-04

Task 72-00-35-210-004:

1. Inspect HPC Rear Drum OD Thrust Balance Seal

A. Equipment And Materials Required - None

B. Procedure

See Figure 801 and Table 801.

(1) Fluorescent penetrant inspect the HPC rear drum OD thrust balance seal knife edge for cracks per SPOP 70, high sensitivity (Task 70-33-00-230-004).

NOTE: Coating removal from the knife edges is not required prior to the FPI. See a sample photo of simulated FPI indication on the coated knife edge.

(2) Visually inspect the HPC rear drum OD thrust balance seal knife edges for surface damage and cracks. Use a fluorescent (white) light and a 3X - 8X magnifying glass.

(3) If a crack is detected by either FPI and/or visual inspection, do the following.

(a) Remove the HPC rear drum from the HPC module.

(b) Inspect the HPC rear drum OD thrust balance seal per 72-35-08, Inspection/Check-02 (Task 72-35-08-200-002) and 72-35-08, Inspection/Check-03 (Task 72-35-08-200-003).

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-04

Inspect	Serviceable Limits	Repairable Limits	Repair
Cracks	No cracks permitted		
Coating chipping	Chipping which does not expose base coat is acceptable. Chipping to base coat for a total added length of 25% of knife edge circumference. No single chip to base coat can be more than 45 degrees along the circumference.		

NOTE: Metal transfer on knife edges from honeycomb seal land may be seen. The matal transfer is acceptable. Verify whether it is metal transfer or a coating chipping.

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) - REPAIR-01

Task 72-00-35-300-001:

1. Blend Repair Of Stage 5, 6 And 7 Rotor Blades For A Fully Built HPC Module - Axial Compressor Rotor Assembly

R NOTE: This Repair Is Relocated To 72-00-00, Repair-02.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-01

Task 72-00-41-020-001:

1. Remove Diffuser And Combustor (Vertical)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 Task 72-00-34-050-001).

(2) Remove The Main Gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001).

(3) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(4) Remove The 1st Stage LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(5) Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(6) Remove The Low Pressure Compressor. Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(7) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(8) Remove The Low Pressure Turbine With Shaft. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(9) Remove The Fan Case. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-001).

(10) Remove The No. 1 Bearing Support Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(11) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(12) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(13) Remove The No. 3 Bearing Rear Seal Assembly. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

(14) Trunnion The Intermediate Case Through Diffuser And Combustor From Horizontal To Front End Down Position. Refer to 72−00−00, Special Procedures−09 (Task 72−00−00−020−002−A).

(15) Disconnect/Remove The External Parts To Gain Access To Diffuser And Combustor. Refer to 72−00−41, Removal−02 (Task 72−00−41−020−002).

B. Equipment And Materials Required

Standard Tools:

0.250−28 Jackscrews (Four Required)

Special Tools:

PWA 28657	Sling
PWA 29389	Pump, Hydraulic
PWA 76154	Adapters (Two Required)
PWA 80187	Multiplier, Torque
PWA 85056	Cover, Protector (Optional To PWA 85802)
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85069	Puller, Jackscrew
PWA 85071	Puller, Hydraulic
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85428	Protector, Plastic
PWA 85701	Guide
PWA 85751	Bracket, Handling (Two Required)
PWA 85802	Cover, Protector
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 86489	Puller, Jackscrew
PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

C. Procedure

(1) Position PWA 85168 Protector (302/8), (303/8), smaller end first, into diffuser case. Push protector down to seat in case.

(2) Remove PWA 85159 Thread Protector (302/2), (303/2) from rear of HPC rear hub. See Figure 302 and Figure 303.

(3) Remove No. 3 bearing inner race and rollers (302/3), (303/3) using PWA 85071 Puller(302/1), (303/1).

(a) Retract hydraulic cylinder ram as required. Remove jaw retaining ring of puller.

(b) Position puller over HPC rear hub (302/9), (303/9) and engage jaws with puller groove in No. 3 bearing inner race. Position retaining ring over jaws and seat on flange of jaws. Secure retaining ring using knurled screw.

(c) Connect PWA 29389 Hydraulic Pump to hydraulic cylinder.

(d) Actuate hydraulic pump to separate inner race from tight fit on hub.

(e) Remove hydraulic pump. Remove retaining ring securing jaws. Remove puller from engine.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT BEARINGS BY STORING IN A SUITABLE CONTAINER.

(f) Remove bearing inner race and rolls from HPC rear hub and place in suitable labeled container.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(4) Remove No. 3 bearing outer race (303/11) - For engines when it is necessary to remove outer race from diffuser and combustor when it is installed on the high pressure compressor. See Figure 303.

NOTE: See 72-41-00, Removal-01 Task 72-41-00-030-004 for the removal of the No. 3 bearing outer race from the diffuser and combustor when it is not installed on the engine.

NOTE: See 72-41-00, Disassembly-03 Task 72-41-00-030-003-001 or 72-41-00, Dissasembly-04 Task 72-41-00-030-003-002 for removal of outer race from the No. 3 bearing duct and housing after the duct and housing has been removed from the diffuser and combustor.

(a) Remove PWA 85168 Protector (303/8).

(b) Install six workbolts, lubricated with Engine Oil P03-001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 - 325 lb-in. (32.766 - 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375-24 by 1.000 inch (25.400 mm) thread length.

(c) Install PWA 85168 Protector (303/8).

(d) Remove rivet (303/13) from retaining nut (303/12) in housing and discard rivet.

(e) With PWA 86491 Driver or PWA 85797 Wrench (303/15), loosen and remove the retaining nut (303/12) from housing.

NOTE: If you use PWA 86491Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) - See Figure 303, Sheet 2. With PWA 102743 Torque Adapter (303/16), PWA 102744 Holder Adapter (303/17), and PWA 80187 Torque Multiplier (303/18), loosen and remove the retaining nut (303/12) from the housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(g) With PWA 86489 Puller (303/10) remove the No. 3 bearing outer race (303/11) from housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the bearing outer race.

(h) Remove PWA 85168 Protector (303/8) and the six workbolts (303/14) from the bearing housing.

(i) Install PWA 85168 Protector (303/8), smaller end first, into diffuser case. Push protector down to seat in case.

(5) Remove No. 3 bearing seal spacer (302/5), (303/5) with PWA 85068 Fixture (302/4), (303/4).

NOTE: If the No. 3 bearing outer race has not been removed by the above procedure, install PWA 85802 Protector Cover or PWA 85056 Protector Cover (302/10) over outer race.

(a) Loosen screws and wing nuts securing jaws.

(b) Position puller over HPC rear hub. Slide jaws behind rear flange of seal spacer. Tighten screws and wing nuts to secure jaws.

(c) Pull fixture by hand to remove spacer.

(d) If spacer cannot be removed by hand, install PWA 85069 Puller to upper flange of fixture per following step.

(e) Retract center jackscrew of PWA 85069 Puller and position puller to upper flange of PWA 85068 Fixture. Secure puller to fixture with detail screws. Using standard wrench, tighten center jackscrew to seat center puck in HPC rear hub. Continue tightening jackscrew to remove seal spacer from tight fit on hub. Remove screws securing puller to fixture. Remove puller.

(f) Loosen screws and wing nuts securing jaws to ring detail of PWA 85068 Fixture. Remove fixture.

(g) Remove seal spacer from HPC rear hub.

(6) Remove No. 3 bearing front seal seat (302/7), (303/7) with PWA 85067 Fixture (302/6), (303/6).

(a) Loosen screws and hand knobs securing jaws to fixture.

(b) Position fixture over HPC rear hub with fixture locating on seal seat. Slide jaws outward to engage pulling flange of seat. Tighten upper screws to secure jaws. Tighten hand knobs to fully engage jaws in pulling groove of seal seat.

(c) Pull fixture by hand to remove seal seat.

(d) If seal seat cannot be removed by hand, install PWA 85069 Puller to upper flange of fixture per following step.

(e) Retract center jackscrew of PWA 85069 Puller and position puller to upper flange of PWA 85067 Fixture. Secure puller to fixture with detail screws. Using standard wrench tighten center jackscrew to seat center puck in HPC rear hub. Continue tightening jackscrew to remove seal seat from tight fit on hub. Remove screws securing puller to fixture. Remove puller.

(f) Loosen screws and hand knobs securing jaws to ring detail of fixture. Remove fixture.

(g) Remove seal seat from HPC rear hub.

(7) Remove the Flange K hardware as follows. Refer to 72−00−41 Removal−20 (Task 72−00−41−020−020).

(8) For PWA 85701 Guide, retract two setscrews or side of guide. Position PWA 85308 Guide or PWA 85701 Guide, larger diameter end first, over HPC rear hub. Seat on seal plate shoulder of hub. For PWA 85701 Guide, handtighten two setscrews on side of guide. See Figure 304.

(9) Install two PWA 85751 Handling Brackets to diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

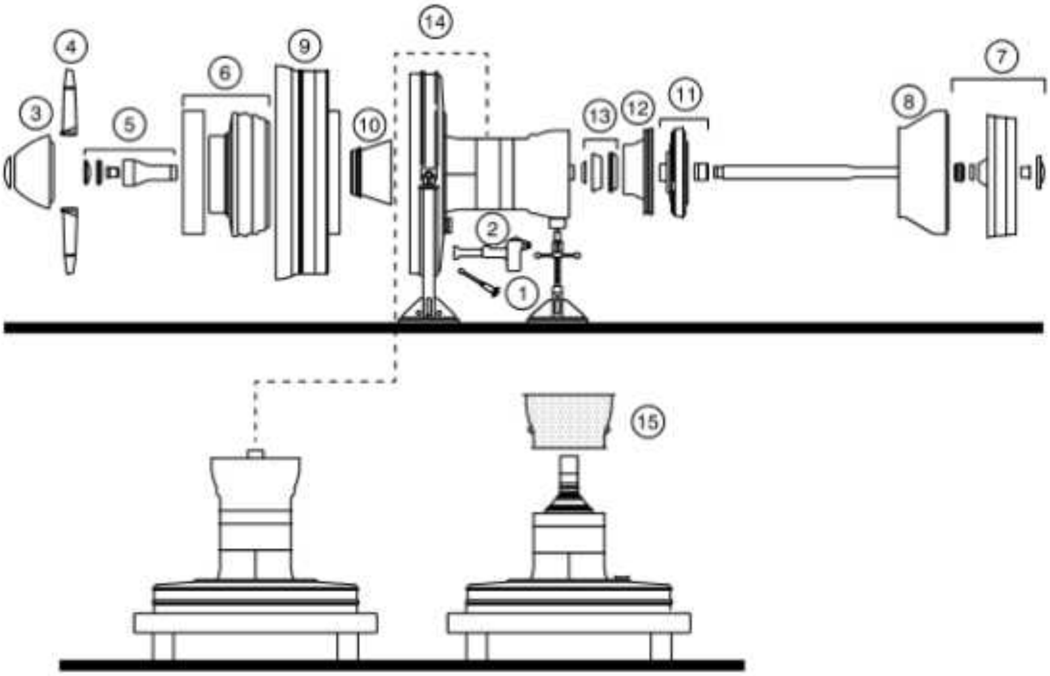
(10) Using hoist, connect PWA 28657 Sling with two PWA 76154 Adapters to outer trunnion spools of brackets. Load hoist, and using 0.250−28 Jackscrews at Flange K, separate diffuser and combustor from engine.

(11) Hoist diffuser case assembly upward to clear engine.

(12) Remove gasket from rear flange of HPC rear case if equipped (Post SB PW4ENG 72−48).

(13) Lower diffuser case assembly onto pallet front end down. Remove PWA 85751 Brackets from case. For PWA 85701 Guide, retract two setscrews on side of guide. Remove PWA 85701 Guide or PWA 85308 Guide from HPC rear hub.

(14) Install PWA 85428 Protector over No. 3 bearing rear seal knife−edge on HPC rear hub. Reinstall PWA 85159 Protector over threads and splines of HPC rear hub.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE MAIN GEARBOX.
3. REMOVE COMPRESSOR INLET CONE.
4. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
5. REMOVE LPC/LPT COUPLING.
6. REMOVE LOW PRESSURE COMPRESSOR (LPC).
7. REMOVE TURBINE EXHAUST CASE.
8. REMOVE LOW PRESSURE TURBINE (LPT).
9. REMOVE FAN CASE.
10. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
14. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO FRONT END DOWN.
15. REMOVE DIFFUSER AND COMBUSTOR.

(Task 72−00−41−020−001)

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-01

Task 72-00-41-020-005:

1. Remove Diffuser And Combustor (Vertical)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001).

(2) Remove The Main Gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001).

(3) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(4) Remove The 1st Stage LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(5) Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(6) Remove The Low Pressure Compressor. Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(7) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(8) Remove The Low Pressure Turbine With Shaft. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(9) Remove The Fan Case. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-001).

(10) Remove The No. 1 Bearing Support Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(11) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(12) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(13) Remove The No. 3 Bearing Rear Seal Assembly. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

(14) Trunnion The Intermediate Case Through Diffuser And The Combustor From Horizontal To The Front End Down Position. Refer to 72−00−00, Special Procedures−09 (Task 72−00−00−020−002−A00).

(15) Disconnect/Remove The External Parts To Get Access To The Diffuser And Combustor. Refer to 72−00−41, Removal−02 (Task 72−00−41−020−006).

B. Equipment And Materials Required

Standard Tools:
0.250−28 Jackscrews (Four Necessary)

Special Tools:

PWA 28657	Sling
PWA 29389	Pump, Hydraulic
PWA 76154	Adapters (Two Necessary)
PWA 80187	Multiplier, Torque
PWA 85056	Cover, Protector (Optional To PWA 85802)
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85069	Puller, Jackscrew
PWA 85071	Puller, Hydraulic
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85428	Protector, Plastic
PWA 85701	Guide
PWA 85751	Bracket, Handling (Two Necessary)
PWA 85802	Cover, Protector
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85983	Adapter, Stabilizer (Two Necessary Twin Overhead Rail System Only)
PWA 86489	Puller, Jackscrew
PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

C. Procedure

(1) Install the PWA 85168 Protector (302/8), (303/8), smaller end first, into the diffuser case. Push the protector down to seat in the case.

(2) Remove the PWA 85159 Thread Protector (302/2), (303/2) from the rear of the HPC rear hub. See Figure 302 and Figure 303.

(3) Remove the No. 3 bearing inner race and rollers (302/3), (303/3), use PWA 85071 Puller (302/1), (303/1).

(a) Retract the hydraulic cylinder ram as necessary. Remove the jaw retaining ring of the puller.

(b) Install the puller over the HPC rear hub (302/9), (303/9) and engage the jaws with the puller groove in the No. 3 bearing inner race. Install the retaining ring over the jaws to engage against the flange of the jaws. Attach the retaining ring with the knurled screw.

(c) Attach the PWA 29389 Hydraulic Pump to the hydraulic cylinder.

(d) Operate the hydraulic pump to disengage the inner race from the tight fit on the hub.

(e) Remove the hydraulic pump. Remove the retaining ring from the jaws. Remove the puller from the engine.

CAUTION: YOU MUST WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF THE BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT THE BEARINGS BY STORAGE IN AN APPLICABLE CONTAINER.

(f) Remove the bearing inner race and rollers from the HPC rear hub and put in an applicable labeled container.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND

JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(4) Remove the No. 3 bearing outer race (303/11) − For engines when it is necessary to remove the outer race from the diffuser and combustor when it is installed on the high pressure compressor. See Figure 303.

NOTE: See 72−41−00, Removal−01 Task 72−41−00−030−004 for the removal of the No. 3 bearing outer race from the diffuser and combustor when it is not installed on the engine.

NOTE: See 72−41−00, Disassembly−03 Task 72−41−00−030−003−001 or Dissasembly−04 Task 72−41−00−030−003−002 for removal of the outer race from the No. 3 bearing duct and housing after the duct and housing has been removed from the diffuser and combustor.

(a) Remove the PWA 85168 Protector (303/8).

(b) Install six workbolts, lubricated with Engine Oil P03−001, into the bearing housing channel nuts equally around the housing. Torque the workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(c) Install the PWA 85168 Protector (303/8).

(d) Remove the rivet (303/13) from the retaining nut (303/12) in the housing and discard the rivet.

(e) With PWA 86491 Driver or PWA 85797 Wrench (303/15), loosen and remove the retaining nut (303/12) from housing.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) − See Figure 303, Sheet 2. With PWA 102743 Torque Adapter (303/16), PWA 102744 Holder Adapter (303/17) and PWA 80187 Torque Multiplier (303/18), loosen and remove the retaining nut (303/12) from the housing.

CAUTION: YOU MUST WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING OUTER RACE TO PREVENT BEARING DAMAGE.

(g) With the PWA 86489 Puller (303/10) remove the No. 3 bearing outer race (303/11) from the housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the bearing outer race.

(h) Remove the PWA 85168 Protector (303/8) and the six workbolts (303/14) from the bearing housing.

(i) Install the PWA 85168 Protector (303/8), smaller end first, into diffuser case. Push protector down to engage in the case.

(5) Remove the No. 3 bearing seal spacer (302/5), (303/5) with PWA 85068 Fixture (302/4), (303/4).

NOTE: If the No. 3 bearing outer race has not been removed by the above procedure, install PWA 85802 Protector Cover or PWA 85056 Protector Cover (302/10) over the outer race.

(a) Loosen the screws and wing nuts that attach the jaws.

(b) Install the puller over the HPC rear hub. Move the jaws behind the rear flange of the seal spacer. Tighten the screws and wing nuts to attach the jaws.

(c) Pull the fixture by hand to remove the spacer.

(d) If the spacer cannot be removed by hand, install the PWA 85069 Puller to the upper flange of the fixture by the steps that follow.

1 Retract the center jackscrew of the PWA 85069 Puller and install the puller to the upper flange of the PWA 85068 Fixture. Attach the puller to the fixture with detail screws. Use a standard wrench and tighten the center jackscrew to engage the center puck in the HPC rear hub. Continue to tighten the jackscrew to remove the seal spacer from the tight fit on the hub. Remove the screws that attach the puller to the fixture. Remove the puller.

2 Loosen the screws and wing nuts that attach the jaws to the ring detail of the PWA 85068 Fixture. Remove the fixture.

3 Remove the seal spacer from the HPC rear hub.

(6) Remove the No. 3 bearing front seal seat (302/7), (303/7) with the PWA 85067 Fixture (302/6), (303/6).

(a) Loosen the screws and hand knobs that attach the jaws to the fixture.

(b) Install the fixture over the HPC rear hub with the fixture installed on the seal seat. Slide the jaws outward to engage the pulling flange of the seat. Tighten the upper screws to engage the jaws. Tighten the hand knobs to fully engage the jaws in the pulling groove of the seal seat.

(c) Pull the fixture by hand to remove the seal seat.

(d) If the seal seat cannot be removed by hand, install the PWA 85069 Puller to the upper flange of the fixture by the steps that follow:

1 Retract the center jackscrew of the PWA 85069 Puller and install the puller to the upper flange of the PWA 85067 Fixture. Attach the puller to the fixture with detail screws. Use a standard wrench and tighten the center jackscrew to engage the center puck in the HPC rear hub. Continue to tighten the jackscrew to remove the seal seat from the tight fit on the hub. Remove the screws that attach the puller to the fixture. Remove the puller.

2 Loosen the screws and hand knobs that attach the jaws to the ring detail of the fixture. Remove the fixture.

3 Remove the seal seat from the HPC rear hub.

(7) Remove the Flange K hardware as follows: Refer to 72-00-41, Removal-20 (Task 72-00-41-020-020).

(8) For PWA 85701 Guide, retract the two setscrews on the side of the guide. Install the PWA 85308 Guide or PWA 85701 Guide, larger diameter end first, over the HPC rear hub. Engage against seal plate shoulder of the hub. For PWA 85701 Guide, hand tighten the two setscrews on side of guide. See Figure 304.

(9) Install two PWA 85751 Handling Brackets to the diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations, install four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Put the shorter rear flange of the bracket to the front of the diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket in the rear most two holes as marked on the bracket.

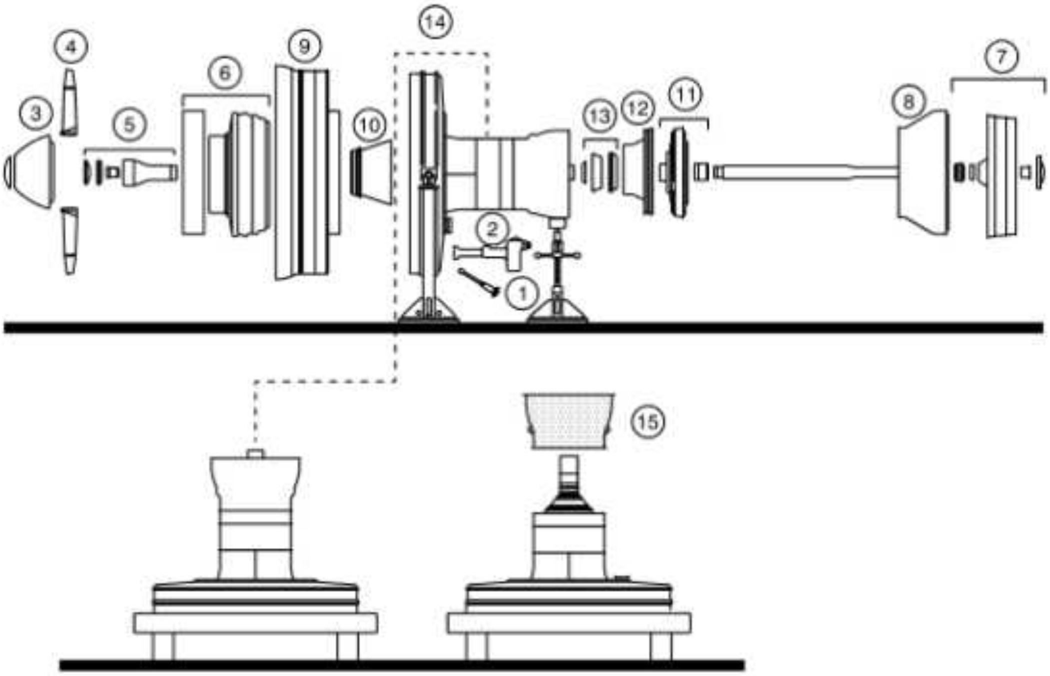
(10) Use a hoist and connect the PWA 28657 Sling with two PWA 76154 Adapters to the outer trunnion spools of the brackets. Load the hoist, and use a 0.250−28 Jackscrews at Flange K to separate the diffuser and combustor from the engine.

(11) Hoist the diffuser case assembly upward to clear the engine.

(12) Remove the gasket from the rear flange of the HPC rear case.

(13) Lower the diffuser case assembly onto a pallet front end down. Remove the PWA 85751 Brackets from the case. For PWA 85701 Guide, retract two setscrews on the side of the guide. Remove PWA 85701 Guide or PWA 85308 Guide from the HPC rear hub.

(14) Install the PWA 85428 Protector over the No. 3 bearing rear seal knife−edge on the HPC rear hub. Install the PWA 85159 Protector over the threads and splines of the HPC rear hub.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE MAIN GEARBOX.
3. REMOVE COMPRESSOR INLET CONE.
4. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
5. REMOVE LPC/LPT COUPLING.
6. REMOVE LOW PRESSURE COMPRESSOR (LPC).
7. REMOVE TURBINE EXHAUST CASE.
8. REMOVE LOW PRESSURE TURBINE (LPT).
9. REMOVE FAN CASE.
10. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
14. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO FRONT END DOWN.
15. REMOVE DIFFUSER AND COMBUSTOR.

Diffuser And Combustor
Figure 304
(Task 72−00−41−020−005)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-41-020-002:

1. Remove External Plumbing Prior To Diffuser And Combustor Removal

A. Equipment And Materials Required - None

B. Procedure
See Figure 301, Figure 302, Figure 303, Figure 304, Figure 305, Figure 306 and Figure 307.

(1) If not previously accomplished, remove four bolts and bracket (Pre SB PW4ENG 73-163 only) securing fuel flowmeter and support to fuel distribution valve. Remove flowmeter and support. Discard packing.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(2) Remove pressure (CP11) and return (CR13) flex hoses as follows.

(a) Disconnect two hose nuts from turbine case cooling air valve actuator and from manifold couplings. Remove hoses.

(b) Install protective closures.

(3) Remove diffuser seal air vent tube assemblies (AP21) and (AP17) as follows.

(a) Remove the bolt and nut that attach two clamps to the bracket on the tube flange at approximately 3 o'clock position on diffuser case.

(b) Remove the lockwire and the bolts that attach the tube (AP21) and bracket to the diffuser case at approximately 3 o'clock position.

(c) Remove the four bolts that attach the (AP21) tube to the lower (AP17) tube. Remove the bracket from he flange of the tube (AP21) (Post SB PW4ENG 75-95).

(d) Remove the bolt, nut, and clamp that attach the tubes to the brackets.

CAUTION: WHEN YOU REMOVE THE (AP21) RIGHT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(e) Remove the tube. Remove the locks and gaskets. Discard the gaskets.

(f) (Pre SB PW4ENG 72-514) Remove the tube. Remove the locks and gaskets. Discard the gaskets.

(g) (Post SB PW4ENG 72-514 and Pre SB PW4ENG 72-572) Remove the tube. Remove the metering plug, locks and gaskets. Discard the gaskets.

(h) (Post SB PW4ENG 72-572) Remove the tube. Remove the locks and gaskets. Discard the gaskets.

(i) Remove the four bolts that attach the (lower) tube to the diffuser case (AP17). Remove the tube, gaskets, and deflector. Discard the gaskets. Install covers.

(4) Remove No. 3 bearing cooler air tube assemblies (AP33) and (AP34) as follows. See Figure 302.

(a) Remove bolts, nuts, and gearbox heat shields to gain access to elbow connections located on HPC rear case at approximately 5 o'clock position.

(b) (Post SB PW4ENG 75-95 and Pre SB PW4ENG 75-144) Remove lockwire from the tube nut and disconnect the No. 3 bearing breather valve air supply tube assembly (AP39) from the air tube (AP34).

(c) Remove lockwire and disconnect No. 3 bearing cooler air tube nuts from cooler at approximately the 2 o'clock position in fan case. Remove lockwire and disconnect tube nuts on rearward ends of tubes from HPC case and diffuser case elbows.

(d) Remove bolts, nuts, and clamps securing tubes to bracket attached to Flange J at approximately 4:30 o'clock position.

(e) Remove bolt, nut, and clamps securing tubes to Flange H bracket at approximately 3 o'clock position.

(f) Remove bolts, nuts, and clamps securing heat shield to tubes at approximately 2:30 o'clock position forward of Flange H. Remove heat shield from engine.

(g) Remove bolts, and clamps securing tubes to HPC bracket at approximately 2:30 o'clock position. Remove tubes from engine and install protective closures.

(5) Remove HPC air and bleed valve supply tube assembly (AA23) as follows. See Figure 303.

(a) Remove lockwire and disconnect tube nut from upper HPC bleed air filter at approximately 2 o'clock position forward of Flange J.

(b) Remove lockwire and disconnect tube nut from diffuser case adapter at approximately 2 o'clock position.

(c) Remove bolt, nut, and clamps securing tubes to Flange K bracket at approximately the 1 o'clock position. Remove tube from engine and install protective closures.

(6) (Pre SB PW4ENG 72-567) Remove EEC PB tube assembly (AS09) as follows. (See Figure 303 (Sheets 1, 4 and 5).

R
R

(a) Remove lockwire and disconnect tube from diffuser case adapter at approximately 1 o'clock position.

(b) Remove lockwire and disconnect tube nut from tube coupling rearward of Flange E at approximately 12:30 o'clock position.

(c) Remove bolts, nuts, spacer, and clamps securing tube to Flange H bracket and HPC bracket at approximately 12:30 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position.

(e) Remove the tube from the engine and install protective closures.

(7) (Post SB PW4ENG 72−567) Remove EEC PB tube assembly (AS09) as follows. See Figure 303 (Sheets 2 through 5).

(a) Remove the lockwire and disconnect the tube from the diffuser case at approximately the 3 o'clock position.

(b) Remove lockwire and disconnect tube nut from tube coupling rearward of Flange E at approximately 12:30 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flange H bracket and HPC bracket at approximately 12:30 o'clock position.

(d) Remove bolt, nut and clamp securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position.

(e) Remove the bolt, nut and clamp that attach the tube to a bracket on Flange K at approximately the 1:30 o'clock position.

(f) Remove the bolt and clamp that attach the tube to a bracket on the diffuser case cover at approximately the 1:30 o'clock position.

(g) Remove the bolt and clamp that attach the tube to a bracket on Flange K at approximately the 2:30 o'clock position.

(h) Remove the tube from the engine and install protective closures.

(8) Remove bleed and HPC air valve supply tube assembly (AA34) as follows. See Figure 304.

(a) Remove lockwire and disconnect tube nut from adapter on diffuser case at approximately 12:30 o'clock position.

(b) Remove lockwire and disconnect tube nut from tube coupling adjacent to air filters at approximately 11 o'clock position.

(c) Remove bolt, nut, and clamp securing tube to Flange J bracket.

(d) Remove bolt, nut, and clamp securing tube to Flange K bracket at approximately 12 o'clock position. Remove tube from engine and install protective closures.

(9) Remove No. 3 bearing breather tube assembly (upper) (LB03) as follows.

(a) Remove lockwire and disconnect tube elbow from diffuser case internal tube nut at approximately 1 o'clock position.

(b) Remove bolt and clamp securing tube to bracket at approximately 11 o'clock position.

(c) Remove bolts, nuts, and clamps securing tube to Flange K brackets at approximately 10, 12 and 1 o'clock positions. Remove tube from engine and install protective closures.

(10) Remove No. 3 bearing oil vent tube assembly (front) (LD01) as follows.

(a) Remove lockwire and disconnect tube nut from diffuser case coupling at approximately 8 o'clock position.

(b) Remove bolt, nut, and clamp securing tube to diffuser case bracket at approximately 9 o'clock position. Remove tube from engine and install protective closures.

(11) Remove turbine blade cooling tube assembly (upper) (AP38) as follows. See Figure 305.

(a) Remove bolts securing tube to turbine cooling air shutoff valve on HPC at approximately 10 o'clock position.

(b) Remove lockwire and bolts securing tube to diffuser case pad at approximately 2 o'clock position.

(c) Remove bolt, nut, and clamp securing tube to Flange K bracket at approximately 11 o'clock position.

(d) (Pre SB PW4ENG 72-572 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(e) (Post SB PW4ENG 72-572 and Pre SB PW4ENG 72-627 or Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

NOTE: Do not discard metal gaskets.

(12) (Pre SB PW4ENG 72-567) Remove the diffuser seal air vent tube assembly (left) (AP22) as follows. See Figure 305 (Sheets 1 through 5).

(a) Remove lockwire and disconnect tube nut from diffuser case internal tube at approximately 11 o'clock position.

(b) Remove bolts, nuts, and clamps securing PT4.95 tube and air shutoff valve signal tube to bracket attached to forward end of tube. Remove lockwire, bolts, and bracket securing tube elbow to HPC rear case.

(c) Remove bolt, nut, and clamp securing tube to fuel injector bracket. Remove tube from engine and remove deflector from HPC case. Remove and discard gaskets. Install protective closures.

NOTE: Do not discard metal gaskets.

(13) (Post SB PW4ENG 72-567) Remove the diffuser seal air vent tube assembly (left) (AP22) as follows. See Figure 305 (Sheets 6 through 11).

(a) Remove the lockwire and bolts that attach the tube to the diffuser case pad at approximately the 11 o'clock position.

(b) Remove the lockwire and bolts that attach the tube assembly (AP22) and bracket to the diffuser case pad at approximately the 11:30 o'clock position.

(c) Remove bolts, nuts and clamps that attach the PT4.95 tube (AS01) and the turbine vane cooling air valve signal tube (AA76) to the bracket attached to the flanged end of the tube (AP22). Remove the bracket from the engine.

CAUTION: WHEN YOU REMOVE THE (AP22) LEFT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(d) Remove the bolt, nut and clamp that attach the tube to a fuel injector bracket. Remove the tube from the engine. Remove the deflector from the recessed area of the diffuser case pad. Remove and discard the gaskets from the tube flanged end and from the diffuser case pad. Remove the tube locks and gaskets from the diffuser case pad and install protective covers.

NOTE: Do not discard metal gasket.

(14) (Pre SB PW4ENG 79-52) Remove the No. 3 bearing oil pressure tube assembly (LP19) as follows. See Figure 306.

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE STRAINER HOUSING WHEN YOU LOOSEN OR TIGHTEN THE STRAINER. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) Remove the lockwire. While you hold the strainer housing with a wrench, loosen and remove the strainer from the housing. Remove the packing and discard.

(b) Remove hose clamp securing spray shield to No. 3 bearing oil pressure manifold at approximately 9 o'clock position. Remove spray shield from engine. Remove lockwire and disconnect manifold nut from tube strainer housing.

(c) Remove lockwire and disconnect tube nut from diffuser case internal tube at approximately 10 o'clock position.

(d) Remove bolts, nuts, and clamps securing tube to Flange K bracket. Remove tube from engine and install protective closures.

(15) (Post SB PW4ENG 79−52) (Pre/Post SB PW4ENG 72−491) Remove the No. 3 bearing oil pressure tube assembly (LP19) as follows. See Figure 306.

(a) Remove the bolt from the clamp that attaches the No. 3 bearing oil pressure manifold (LP18) and spray shield to a bracket attached to flange of cooling air tube (AS03) on the high compressor at approximately the 9 o'clock position. Remove the bolt and spray shield.

(b) Remove the lockwire and disconnect the manifold nut from the tube adapter.

(c) Remove the bolts that attach the ferrule end of the tube (LP19) to a bracket assembly on Flange K. Remove the bolt, nut and clamp that attach the tube to a bracket on Flange K at approximately the 9:30 o'clock position.

(d) Remove the lockwire from the bolts that attach the adapter and a strainer into the ferrule end of the tube. Remove the bolts and nuts from the adapter. Remove the adapter and strainer from the tube. Remove the packing from the adapter and discard.

(e) Remove the lockwire and disconnect the tube nut from the diffuser case internal tube at approximately the 10 o'clock position. Remove the tube from the engine and install protection covers.

(16) (Pre SB PW4ENG 72-491) Remove No. 4 bearing oil pressure assembly (front) (LP15) as follows.

(a) Remove hose clamp and spray shield from tube connection at tee forward of Flange J at approximately 8 o'clock position.

(b) Remove lockwire and disconnect tube nut from tee.

(c) Remove bolt, nut, and clamp securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to fuel injector bracket at approximately 9 o'clock position.

(e) Remove bolt, spacer, nut, and clamp securing tube to EEC PT4.95 tube at approximately 9:30 o'clock position. Remove tube from engine and install protective closures. If equipped remove the clamp and clip-on wear sleeves from PT4.95 tube (AS01).

(17) (Post SB PW4ENG 72-491) Remove No. 4 bearing oil pressure tube assembly (front) (LP15) as follows.

(a) Remove hose clamps and spray shields from tube connection at tee forward of Flange J at approximately 8 o'clock position and the tee fitting at the deoiler idler bearing pressure line (LP35) connection.

(b) Remove lockwire and disconnect tube nuts from tees.

(c) Remove bolt, nut, and clamp securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to fuel injector bracket at approximately 9 o'clock position.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−02

(e) Remove bolt and clamp that holds the tube to Flange K bracket assembly at approximately 9 o'clock position.

(f) Remove bolt, spacer, nut, and clamp securing tube to EEC PT4.95 tube at approximately 9:30 o'clock position. Remove tubes from engine and install protective closures. If equipped remove the clamp and clip−on wear sleeves from PT4.95 tube (AS01).

(18) Remove EEC PT4.95 tube assembly (AS01) as follows.

(a) Remove lockwire and disconnect tube nut from tube coupling at forward end of tube.

(b) Remove bolts, nuts, and clamps securing tube to engine.

(c) Remove tube from engine and install protective closures.

(19) Remove the gearbox heat shields as follows. See Figure 307.

(a) Remove the bolts and nuts that attach the heat shields to the Flanges J and K brackets and to each other.

(b) Remove the heat shields.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-02

Task 72-00-41-020-006:

1. Remove External Plumbing Prior To Diffuser And Combustor Removal

A. Equipment And Materials Required - None

B. Procedure
See Figure 301, Figure 302, Figure 303, Figure 304, Figure 305, Figure 306 and Figure 307.

(1) If not previously accomplished, remove four bolts and bracket (Pre SB PW4ENG 73-163 only) securing fuel flowmeter and support to fuel distribution valve. Remove flowmeter and support. Discard packing.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(2) Remove pressure (CP11) and return (CR13) flex hoses as follows.

(a) Disconnect two hose nuts from turbine case cooling air valve actuator and from manifold couplings. Remove hoses.

(b) Install protective closures.

(3) Remove diffuser seal air vent tube assemblies (AP21) and (AP17) as follows.

(a) Remove the bolt and nut that attach two clamps to the bracket on the tube flange at approximately 3 o'clock position on diffuser case.

(b) Remove the lockwire and the bolts that attach the tube (AP21) and bracket to the diffuser case at approximately 3 o'clock position.

(c) Remove the four bolts that attach the (AP21) tube to the lower (AP17) tube. Remove the bracket from the flange of the tube (AP21).

(d) Remove the bolt, nut, and clamp that attach the tubes to the brackets.

CAUTION: WHEN YOU REMOVE THE (AP21) RIGHT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(e) Remove the tube. Remove the locks and gaskets. Discard the gaskets.

(f) Remove the four bolts that attach the (lower) tube to the diffuser case (AP17). Remove the tube, gaskets, and deflector. Discard the gaskets. Install covers.

(4) Remove No. 3 bearing cooler air tube assemblies (AP33) and (AP34) as follows. See Figure 302.

(a) Remove bolts, nuts, and gearbox heat shields to gain access to elbow connections located on HPC rear case at approximately 5 o'clock position.

(b) (Pre SB PW4ENG 75−144) Remove the lockwire from the tube nut and disconnect the No. 3 bearing breather valve air supply tube assembly (AP39) from the air tube (AP34).

(c) Remove lockwire and disconnect No. 3 bearing cooler air tube nuts from cooler at approximately the 2 o'clock position in fan case. Remove lockwire and disconnect tube nuts on rearward ends of tubes from HPC case and diffuser case elbows.

(d) Remove bolts, nuts, and clamps securing tubes to bracket attached to Flange J at approximately 4:30 o'clock position.

R
R

(e) Remove bolt, nut, and clamps securing tubes to Flange H bracket at approximately 3 o'clock position.

(f) Remove bolts, nuts, and clamps securing heat shield to tubes at approximately 2:30 o'clock position forward of Flange H. Remove heat shield from engine.

(g) Remove bolts, and clamps securing tubes to HPC bracket at approximately 2:30 o'clock position. Remove tubes from engine and install protective closures.

(5) Remove HPC air and bleed valve supply tube assembly (AA23) as follows. See Figure 303.

(a) Remove lockwire and disconnect tube nut from upper HPC bleed air filter at approximately 2 o'clock position forward of Flange J.

(b) Remove lockwire and disconnect tube nut from diffuser case adapter at approximately 2 o'clock position.

(c) Remove bolt, nut, and clamps securing tubes to Flange K bracket at approximately the 1 o'clock position. Remove tube from engine and install protective closures.

(6) Remove EEC PB tube assembly (AS09) as follows.

(a) Remove the lockwire and disconnect the tube from the diffuser case at approximately the 3 o'clock position.

(b) Remove lockwire and disconnect tube nut from tube coupling rearward of Flange E at approximately 12:30 o'clock position.

(c) Remove bolts, nuts, spacer, and clamps securing tube to Flange H bracket and HPC bracket at approximately 12:30 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position.

(e) Remove the bolt, nut and clamp that attach the tube to a bracket on Flange K at approximately the 1:30 o'clock position.

(f) Remove the bolt and clamp that attach the tube to a bracket on the diffuser case cover at approximately the 1:30 o'clock position.

(g) Remove the bolt and clamp that attach the tube to a bracket on Flange K at approximately the 2:30 o'clock position.

(h) Remove the tube from the engine and install protective closures.

(7) Remove bleed and HPC air valve supply tube assembly (AA34) as follows. See Figure 304.

(a) Remove lockwire and disconnect tube nut from adapter on diffuser case at approximately 12:30 o'clock position.

(b) Remove lockwire and disconnect tube nut from tube coupling adjacent to air filters at approximately 11 o'clock position.

(c) Remove bolt, nut, and clamp securing tube to Flange J bracket.

(d) Remove bolt, nut, and clamp securing tube to Flange K bracket at approximately 12 o'clock position. Remove tube from engine and install protective closures.

(8) Remove No. 3 bearing breather tube assembly (upper) (LB03) as follows.

(a) Remove lockwire and disconnect tube elbow from diffuser case internal tube nut at approximately 1 o'clock position.

(b) Remove bolt and clamp securing tube to bracket at approximately 11 o'clock position.

(c) Remove the bolt , nut and clamp from the No. 3 bearing breather tube (LB03) that is attached to the bracket on the diffuser case pad with tube assembly (AP22) at approximately the 11:30 o'clock position.

(d) Remove bolts, nuts, and clamps securing tube to Flange K brackets at approximately 10, 12 and 1 o'clock positions. Remove tube from engine and install protective closures.

(9) Remove No. 3 bearing oil vent tube assembly (front) (LD01) as follows.

(a) Remove lockwire and disconnect tube nut from diffuser case coupling at approximately 8 o'clock position.

(b) Remove bolt, nut, and clamp securing tube to diffuser case bracket at approximately 9 o'clock position. Remove tube from engine and install protective closures.

(10) Remove turbine blade cooling tube assembly (upper) (AP38) as follows. See Figure 305.

(a) Remove bolts securing tube to turbine cooling air shutoff valve on HPC at approximately 10 o'clock position.

(b) Remove lockwire and bolts securing tube to diffuser case pad at approximately 2 o'clock position.

(c) Remove bolt, nut, and clamp securing tube to Flange K bracket at approximately 11 o'clock position.

(d) (Pre SB PW4ENG 72-537) Remove tube from engine. Remove and discard gaskets. Remove metering plate and tube locks. Install protective closures.

(e) (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

(f) (Post SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(11) Remove the diffuser seal air vent tube assembly (left) (AP22) as follows.

(a) Remove the lockwire and bolts that attach the tube to the diffuser case pad at approximately the 11 o'clock position.

(b) Remove the lockwire and bolts that attach the tube assembly (AP22) and bracket to the diffuser case pad at approximately the 11:30 o'clock position.

(c) Remove bolts, nuts and clamps that attach the PT4.95 tube (AS01) and the turbine vane cooling air valve signal tube (AA76) to the bracket attached to the flanged end of the tube (AP22). Remove the bracket from the engine.

CAUTION: WHEN YOU REMOVE THE (AP22) LEFT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(d) Remove the bolt, nut and clamp that attach the tube to a fuel injector bracket. Remove the tube from the engine. Remove the plate (Pre SB PW4ENG 75-110) or deflector (Post SB PW4ENG 75-110) from the recessed area of the diffuser case pad. Remove and discard the gaskets from the tube flanged end and from the diffuser case pad. Remove the tube locks and gaskets from the diffuser case pad and install protective covers.

NOTE: Do not discard metal gasket.

(12) (Pre/Post SB PW4ENG 72-491) Remove the No. 3 bearing oil pressure tube assembly (LP19) as follows. See Figure 306.

(a) Remove the bolt from the clamp that attaches the No. 3 bearing oil pressure manifold (LP18) and spray shield to a bracket attached to flange of cooling air tube (AS03) on the high compressor at approximately the 9 o'clock position. Remove the bolt and spray shield.

(b) Remove the lockwire and disconnect the manifold nut from the tube adapter.

(c) Remove the bolts that attach the ferrule end of the tube (LP19) to a bracket assembly on Flange K. Remove the bolt, nut and clamp that attach the tube to a bracket on Flange K at approximately the 9:30 o'clock position.

(d) Remove the lockwire from the bolts that attach the adapter and a strainer into the ferrule end of the tube. Remove the bolts and nuts from the adapter. Remove the adapter and strainer from the tube. Remove the packing from the adapter and discard.

(e) Remove the lockwire and disconnect the tube nut from the diffuser case internal tube at approximately the 10 o'clock position. Remove the tube from the engine and install protection covers.

NOTE: Do not discard the metal gasket.

(13) (Pre SB PW4ENG 72-491) Remove No. 4 bearing oil pressure tube assembly (front) (LP15) as follows.

(a) Remove hose clamp and spray shield from tube connection at tee forward of Flange J at approximately 8 o'clock position.

(b) Remove lockwire and disconnect tube nut from tee.

(c) Remove bolt, nut, and clamp securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to fuel injector bracket at approximately 9 o'clock position.

(e) Remove bolt, spacer, nut, and clamp securing tube to EEC PT4.95 tube at approximately 9:30 o'clock position. Remove tube from engine and install protective closures. If equipped remove the clamp and clip-on wear sleeves from PT4.95 tube (AS01).

(14) (Post SB PW4ENG 72-491) Remove No. 4 bearing oil pressure tube assembly (front) (LP15) as follows.

(a) Remove hose clamps and spray shields from tube connection at tee forward of Flange J at approximately 8 o'clock position and the tee fitting at the deoiler idler bearing pressure line (LP35) connection.

(b) Remove lockwire and disconnect tube nuts from tees.

(c) Remove bolt, nut, and clamp securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position.

(d) Remove bolt, nut, and clamp securing tube to fuel injector bracket at approximately 9 o'clock position.

(e) Remove bolt and clamp that holds the tube to Flange K bracket assembly at approximately 9 o'clock position.

(f) Remove bolt, spacer, nut, and clamp securing tube to EEC PT4.95 tube at approximately 9:30 o'clock position. Remove tubes from engine and install protective closures. If equipped remove the clamp and clip-on wear sleeves from PT4.95 tube (AS01).

(15) Remove EEC PT4.95 tube assembly (AS01) as follows.

(a) Remove lockwire and disconnect tube nut from tube coupling at forward end of tube.

(b) Remove bolts, nuts, and clamps securing tube to engine.

(c) Remove tube from engine and install protective closures.

(16) Remove the gearbox heat shields as follows. See Figure 307.

(a) Remove the bolts and nuts that attach the heat shields to the Flanges J and K brackets and to each other.

(b) Remove the heat shields.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-03

Task 72-00-41-020-003:

1. Remove No. 3 Bearing Rear Seal Assembly And Rear Seal Seat (Horizontal)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

For vertical removal of No. 3 bearing rear seal assembly and rear seal seat, see Removal-09 (Task 72-00-41-020-004).

A. Prerequisites
   (1) Remove turbine nozzle group per 72-00-51, Removal-01 (Task 72-00-51-020-001).

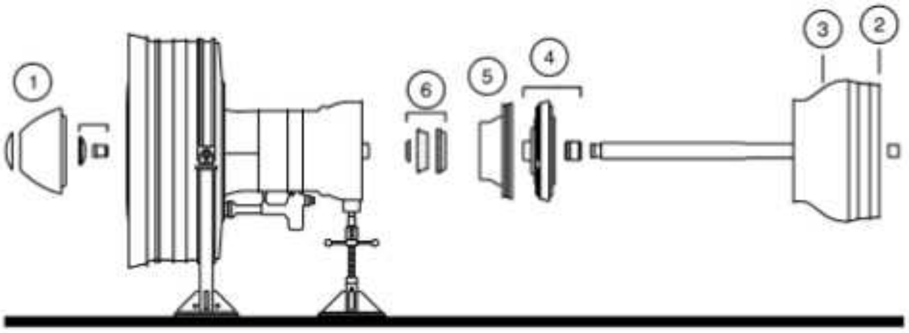
B. Equipment And Materials Required

Standard Tools:
0.250-28 Jackscrews - Four Required

Special Tools:
PWA 29389 Pump, Hydraulic
PWA 85071 Fixture
PWA 85159 Protector Cover
PWA 85697 Puller (2 Required) (Optional to PWA 86629)
PWA 86629 Puller (Optional to PWA 85697)

C. Procedure
See Figure 302.
   (1) Remove 12 bolts (302/6) shouldered washers (302/7) and gaskets (302/8) securing No. 3 bearing rear cooling duct (302/9) to No. 3 bearing rear seal (302/10).
   (2) Remove (PWA 85159) Thread Protector from rear of HPC rear hub.
   (3) Remove No. 3 bearing rear cooling duct (302/9) with two PWA 85697 Pullers (302/5), (optional to PWA 86629 Puller).
      (a) Open jaws of PWA 85697 Puller with knob detail until they can be positioned in and around cooling duct (302/9).
      (b) Locate the outer jaw in front of the puller flange on the outer diameter of the cooling duct. Locate the inner jaw in front of the inner diameter flange of the cooling duct.
      (c) Turn the knob detail to tighten the jaws in position.
      (d) Position the second PWA 85697 Puller 180 degrees apart from the first puller and install by the same method as the first.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−03



1. REMOVE COMPRESSOR INLET CONE
2. TURBINE EXHAUST CASE
3. REMOVE LOW PRESSURE TURBINE
4. REMOVE HIGH PRESSURE TURBINE
5. REMOVE TURBINE NOZZLE
6. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT

L−A0248 (0000)
PW V

Procedure Sequence
Figure 301
(Task 72−00−41−020−003)

(e) Operate both pullers knockers at the same time to remove cooling duct.

NOTE: The puller positions must be moved to a new location when the cooling duct has moved out a small distance. Continue movement of pullers until cooling duct is removed.

(f) Remove cooling duct from engine and place on pallet.
(g) Remove pullers from cooling duct.

(4) Remove No. 3 bearing rear cooling duct (302/9) with PWA 86629 Puller (302/22), (optional to PWA 85697 Puller).
(a) Open the three pairs of jaws with the three hand knobs and back off the three drive assemblies.
(b) Carefully install the PWA 86629 Puller over the HPC rear hub.
(c) Put the outer jaws of the puller on the outer diameter of the cooling duct (302/9). Put the inner jaws on the inner diameter flange of the cooling duct (302/9).
(d) Turn the three knob details to tighten the jaws in position. The jaws must touch the flanges fully and be equal.
(e) Tighten the three drive assemblies with a socket wrench slowly and continuously. Turn each drive assembly an equal angle.
(f) After the cooling duct becomes loose, carefully remove the cooling duct and PWA 86629 Puller from the engine. Put the duct and puller on a work bench.
(g) Loosen the three pairs of jaws with the three hand knobs. Move the jaws away from the cooling duct flanges.
(h) Remove the puller from the cooling duct.

(5) Remove the forty (40) bolt (302/12) that attach the No. 3 bearing rear (carbon) seal assembly (302/10) to the No. 3 bearing support in the diffuser case. Install four 0.250−28 Jackscrews.

CAUTION: DO NOT LET (CARBON) SEAL ASSEMBLY DROP WHEN REMOVING. SEAL CAN BE DAMAGED IF DROPPED ONTO REAR COMPRESSOR DRIVE TURBINE SHAFT.

(6) With jackscrews, remove seal assembly (302/9). Discard gasket (302/11).
(7) Remove No. 3 bearing rear seal seat (302/2) using PWA 85071 Puller (302/3).

- (a) Retract hydraulic cylinder ram as required. Remove jaw retaining ring from jaws.
- (b) Position puller over HPC rear hub and engage jaws behind seal seat. Position jaw retaining ring over jaws and secure using knurled knobs.

  NOTE: Only corners of puller jaws will be in contact with seal seat.

- (c) Connect PWA 29389 Hydraulic Pump to hydraulic cylinder.
- (d) Actuate hydraulic pump to separate seal seat.
- (e) Disconnect hydraulic pump. Remove retaining ring securing jaws. Remove puller from engine.
- (f) Remove seal seat from HPC rear hub and place in suitable container. Discard seal (302/11).

(8) Install PWA 85159 Protector over threads and splines of HPC rear hub.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-04

Task 72-00-41-050-001:

1. Remove Exciter-To-Igniter Plug Cable, (Upper Plug-Upper Box)

A. Equipment And Materials Necessary - None

B. Procedure
See Figure 301 and Figure 302.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Remove the bolt and nut that attaches a clamp on the upper igniter cable to a bracket located between the upper and lower igniter cables.

(2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove heat shields from cable.

(3) (Post SB PW4ENG 73-192) Loosen the clamps that attach the cooling hoses to the heat shield at the exciter end of the cable. Remove cooling hoses from the heat shield.

NOTE: Pre SB PW4ENG 73-192 engines do not have W5/W6 wiring harness connector cooling.

(4) Loosen the clamps that attaches the heat shield segments at the exciter end of the cable. Remove heat shields from cable.

(5) Loosen the cable coupling nut from the upper exciter at the outboard connector. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT

FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(6) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from cable.

(7) Disconnect the coupling nut from the upper exciter at the outboard connector. Remove the heat shield clamps from the cable and remove the cable from the engine.

NOTE: Perform high tension contact, sleeve, rubber bushing and cable insulation inspection during grommet replacement. See Inspection/Check-04 Task 72-00-41-210-004.

(8) Remove grommets from exciter end and igniter end of cable. Discard grommets.

(9) Install protective caps to coupling nuts on both ends of cable and on threaded output connector on ignition exciter.

NOTE: Additional information concerning detailed maintenance of this component may be found in Exciter-To-Igniter Plug Cable Component Maintenance Manual, 74-21-08, (Bendix Aerospace).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-05

Task 72-00-41-050-002:

1. Remove Exciter-To-Igniter Plug Cable, (Lower Plug-Lower Box)
   A. Equipment And Materials Required - None
   B. Procedure
   See Figures 301 and 302.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE INGITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Remove the bolt and nut that attaches a clamp on the lower igniter cable to a bracket located between the upper and lower igniter cables.
(2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove heat shields from cable.
(3) Loosen the clamps that attaches the heat shield segments at the exciter end of the cable. Remove heat shields from cable.
(4) Loosen the cable coupling nut from the lower exciter at the inboard connector. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

(5) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from cable.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−06

Task 72−00−41−050−003:

1. Remove Fuel Distribution Valve

   A. Equipment And Materials Required

      Standard Tools:
      0.190−32 Jackscrews (Two Required)

   B. Procedure
      See Figure 301.
      (1) Remove the bolts that secure the front and rear flanges of the fuel flowmeter support and the bracket (SB PW4ENG 73−163 only) to the fuel flowmeter and to the fuel distribution valve. Remove the bracket and the fuel flowmeter support from the engine.
      (2) Be prepared to receive approximately one quart (one liter) of fuel from transfer tube connection.
      (3) Translate packing transfer tube assembly rearward into distribution valve cover.
      (4) Remove the two bolts securing forward end of valve to bracket on Flange J.
      (5) Remove four bolts securing valve to bracket on Flange K and remove valve from engine using two 0.190−32 Jackscrews. Remove jackscrews.
      (6) Remove eight transfer tubes from adapters on fuel supply tubes. Discard packings.
      (7) Remove packing transfer tube from fuel distribution valve. Discard packings.
      (8) Install protective closures.

      NOTE: For additional information concerning detailed maintenance of this component, see Fuel Distribution Valve Component Maintenance Manual, 73−11−08 (Hamilton Standard Division).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-07

Task 72-00-41-050-004:

1. Remove Igniter Plug
   A. General
      (1) This procedure applies to both igniter plug locations and is used only for removal and installation (replacement) of igniter plug and/or key washer. If boss and/or spacers are to be replaced see Removal-08.
   B. Equipment And Materials Required - None
   C. Procedure
      See Figure 301.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Remove the bolt and nut that attaches a clamp on the exciter-to-igniter cable (the upper or lower cable as necessary) to a bracket located between the upper and lower igniter cables.
(2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove the heat shields from the cable.
(3) Loosen the clamps that attach the heat shield segments at the exciter end of the cable. Remove heat shields from the cable.
(4) Loosen the cable coupling nut from the connector on the exciter. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−07

WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

(5) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from the cable.
(6) Disconnect the coupling nut from the connector on the exciter (upper or lower exciter as necessary). Remove the heat shield clamps from the cable and remove the cable from the engine.
(7) Remove grommet from exiter−to−igniter plug cable and discard.
(8) Install protective caps on cable ends and the connector on the exciter.
(9) Loosen igniter plug while keeping igniter plug boss from turning. Do not remove lockwire from boss.
(10) Remove igniter plug.

NOTE: For additional information concerning detailed maintenance of this component, see Igniter Plug Component Maintenance Manual, 74−22−01, (P&W Manual PN 771346).

(11) If key washer is damaged or worn, unbend tabs, remove and discard key washer.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−08

Task 72−00−41−050−005:

1. Remove Igniter Plug, Igniter Plug Boss And Exciter−To−Igniter Cable

A. General

(1) This procedure applies to both igniter plug locations. If boss or spacer(s) are to be replaced, and parts removed at disassembly are available, use this procedure to check boss and spacer thickness. If none of the above parts are to be replaced, remove igniter plug per Removal−07 Task 72−00−41−050−004.

(2) If boss or spacer(s) are to be replaced, and parts removed at disassembly are not available, igniter plug immersion depth must be determined per Installation−14.

B. Equipment And Materials Required − None

C. Procedure
See Figure 301.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Remove the bolt and nut that attaches a clamp on the exciter−to−igniter cable (the upper or lower cable as necessary) to a bracket located between the upper and lower igniter cables.

(2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove the heat shields from the cable.

(3) Loosen the clamps that attach the heat shield segments at the exciter end of the cable. Remove heat shields from the cable.

(4) Loosen the cable coupling nut from the connector on the exciter. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(5) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from cable.

(6) Disconnect the coupling nut from the connector on the exciter (upper or lower exciter as necessary). Remove the heat shield clamps from the cable and remove the cable from the engine.

(7) Remove igniter plug from boss on diffuser case.

NOTE: Hold boss with wrench to prevent boss from turning while removing igniter.

NOTE: For additional information concerning detailed maintenance of this component see Igniter Plug Component Maintenance Manual 74−22−01, (PW Manual PN 771346).

(8) Remove lockwire, igniter boss, and spacers.

(9) If either boss or classified spacers are to be replaced, measure removed boss, spacers and key washer as indicated in Figure 301, Dimension A.

NOTE: Measurement should be retained for reassembly thickness comparison and possible spacer thickness adjustment.

(10) If key washer is damaged, worn or will not provide an adequate seal, remove and discard key washer.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-09

Task 72-00-41-020-004:

1. Remove No. 3 Bearing Rear Seal Assembly And Rear Seal Seat (Vertical)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

For horizontal removal of No. 3 bearing rear seal assembly and rear seal seat, see Removal-03 (Task 72-00-41-020-003).

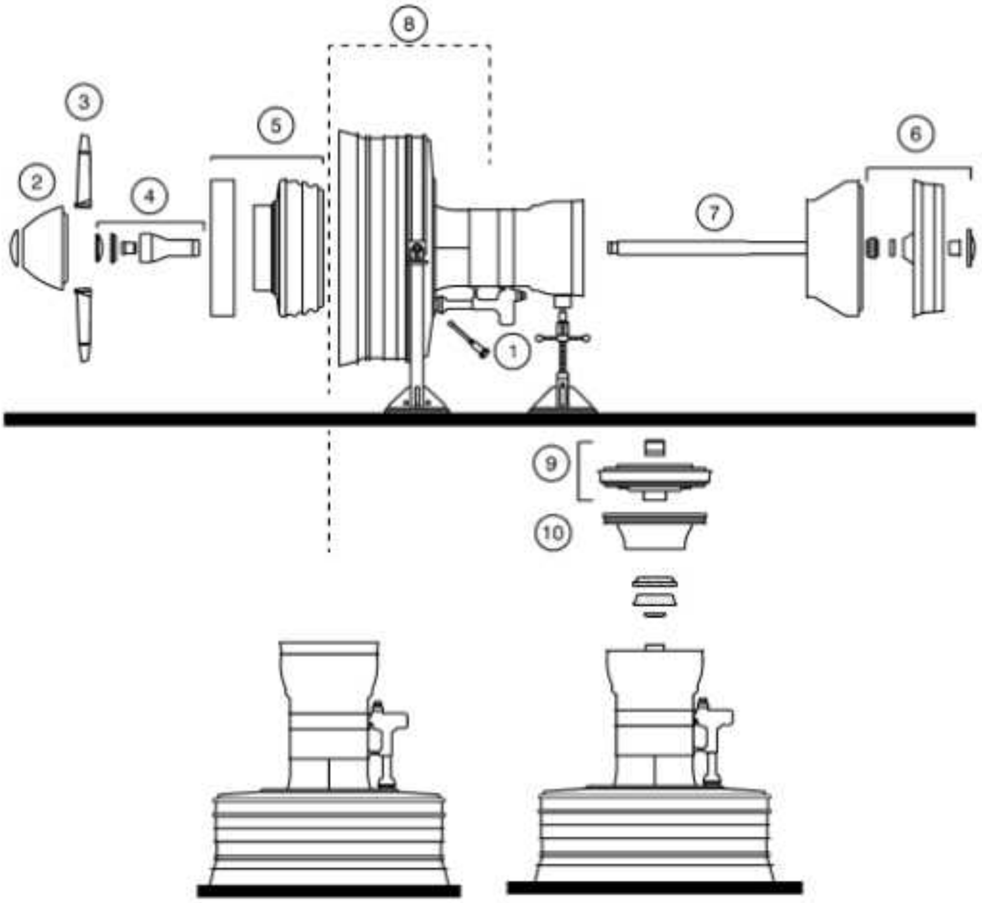
A. Prerequisites
  (1) Remove turbine nozzle group per 72-00-51, Removal-02 (Task 72-00-51-020-002).

B. Equipment And Materials Required

Special Tools:
PWA 29389 Pump, Hydraulic
PWA 85071 Puller, Hydraulic
PWA 85159 Protector, Cover
PWA 85697 Puller (2 Required) (Optional to PWA 86629)
PWA 86629 Puller (Optional to PWA 85697)

Standard Tools:
0.250-28 Jackscrews - Four Required

C. Procedure
See Figure 302.
  (1) Remove 12 bolts (302/1) shouldered washers (302/2) and gaskets (302/3) securing No. 3 bearing rear cooling duct (302/4) to No. 3 bearing rear (carbon) seal (302/5).
  (2) Remove PWA 85159 Thread Protector from rear of HPC rear hub.
  (3) Remove No. 3 bearing rear cooling duct (302/4) with PWA 85697 Pullers. (optional to PWA 86629 Puller).
    (a) Open jaws of PWA 85697 Puller with knob detail until they can be positioned in and around cooling duct.
    (b) Locate the outer jaw in front of the puller flange on the outer diameter of the cooling duct. Locate the inner jaw in front of the inner diameter flange of the cooling duct.
    (c) Turn the knob detail to tighten the jaws in position.
    (d) Position the second PWA 85697 Puller 180 degrees apart from the first puller and install by the same method as the first.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE TURBINE EXHAUST CASE.
7. REMOVE LOW PRESSURE TURBINE (LPT).
8. TRUNNION FAN CASES THROUGH HPT TO FRONT END DOWN.
9. REMOVE HIGH PRESSURE TURBINE (HPT).
10. REMOVE TURBINE NOZZLE.

L-A1251 (0000)
PW V

Procedure Sequence
Figure 301
(Task 72-00-41-020-004)

(e) Operate both pullers knockers at the same time to remove cooling duct.

NOTE: The puller positions must be moved to a new location when the cooling duct has moved out a small distance. Continue movement of pullers until cooling duct is removed.

(f) Remove cooling duct from engine and place on pallet.
(g) Remove pullers from cooling duct.

(4) Remove No. 3 bearing rear cooling duct (302/4) with PWA 86629 Puller (302/20), (optional to PWA 85697 Puller).
(a) Open the three pairs of jaws with the three hand knobs and back off the three drive assemblies.
(b) Carefully install the PWA 86629 Puller over the HPC rear hub.
(c) Put the outer jaws of the puller on the outer diameter of the cooling duct (302/4). Put the inner jaws on the inner diameter flange of the cooling duct (302/4).
(d) Turn the three knob details to tighten the jaws in position. The jaws must touch the flanges fully and be equal.
(e) Tighten the three drive assemblies with a socket wrench slowly and continuously. Turn each drive assembly an equal angle.
(f) After the cooling duct becomes loose, carefully remove the cooling duct and PWA 86629 Puller from the engine. Put the duct and puller on a work bench.
(g) Loosen the three pairs of jaws with the three hand knobs. Move the jaws away from the cooling duct flanges.
(h) Remove the puller from the cooling duct.

(5) Remove 40 bolts (302/10) securing No. 3 bearing rear (carbon) seal (302/5) to No. 3 bearing support in diffuser case.

CAUTION: DO NOT LET (CARBON) SEAL ASSEMBLY DROP WHEN REMOVING IT. SEAL CAN BE DAMAGED IF IT DROPS ONTO REAR COMPRESSOR DRIVE TURBINE SHAFT.

(6) With four 0.250−28 Jackscrews, remove No. 3 bearing rear (carbon) seal assembly. Discard gasket (302/6).
(7) Remove No. 3 bearing rear seal seat (302/8) with PWA 85071 Puller. See Figure 302.

(a) Retract hydraulic cylinder ram as required. Remove jaw retaining ring from jaws.
(b) Position puller over HPC rear hub and engage jaws behind seal seat. Position jaw retaining ring over jaws and secure using knurled knobs.

NOTE: Only corners of puller jaws will be in contact with seal seat.

(c) Connect PWA 29389 Hydraulic Pump to hydraulic cylinder.
(d) Actuate hydraulic pump to separate seal seat.
(e) Disconnect hydraulic pump. Remove retaining ring securing jaws. Remove fixture from engine.
(f) Remove seal seat from HPC rear hub and place in suitable container. Discard seal (302/7).

(8) Install PWA 85159 Protector over threads and splines of HPC rear hub.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-10

Task 72-00-41-060-001:

1. Remove Fuel Distribution Valve Strainer

A. Equipment And Materials Required

Special Tools:
PWA 86459 Puller, Strainer

B. Procedure

See Figure 301.

(1) Remove the bolts that secure the front and rear flanges of the fuel flowmeter support and the bracket (pre SB PW4ENG 73-163 only) to the fuel flowmeter and to the fuel distribution valve. Remove the fuel flowmeter support and the bracket from the engine.

(2) Be prepared to receive approximately one quart (one liter) of fuel from transfer connection.

(3) Translate packing transfer tube assembly rearward into distribution valve cover.

(4) Remove bolts and washers securing strainer housing cover to distribution valve and remove cover and tube from valve. Remove tube from cover. Discard packings from tube and cover.

CAUTION: USE THE PWA 86459 PULLER TO AVOID DAMAGE TO THE STRAINER.

(5) Engage the PWA 86459 Puller to the strainer and pull the strainer from the housing. Disengage the puller from the strainer and remove the puller and strainer from the engine separately. Discard the packing.

(6) Inspect fuel distribution valve strainer per Inspection/Check-05.

(7) Clean fuel distribution valve strainer per Cleaning-03 or -04.

(8) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Fuel Distribution Valve Component Maintenance Manual, 73-11-08 (Hamilton Standard Division).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-11

Task 72-00-41-020-011:

1. Remove Combustion Chamber (Outer) (Horizontal)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

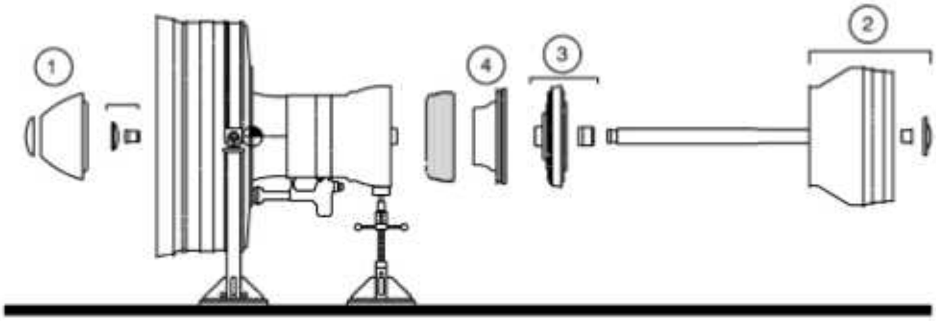
A. Prerequisites
   (1) Remove turbine nozzle - horizontal. See 72-00-51, Removal-01 (Task 72-00-51-020-001).
   (2) Remove igniter plug. See 72-00-41, Removal-07 (Task 72-00-41-050-004).
   (3) Remove fuel injector supply manifold. See 72-00-41, Removal-13 (Task 72-00-41-050-006).

B. Equipment And Materials Required

Special Tools:
PWA 85079 Fixture, Handling

C. Procedure
See Figure 302.
   (1) On PWA 85079 Handling Fixture, loosen two hand knob assemblies to open the clamping plate of the fixture.
   (2) Install the fixture to an overhead hoist and move the fixture to the 12 o'clock position inside the outer combustion chamber. Locate the first step in the clamping plate to the outer rear flange of the combustion chamber and tighten the two hand knob assemblies.
   (3) Remove lockwire loosen and remove twelve doweled end bolts and washers equally spaced around diffuser case.
   (4) Carefully move outer combustion chamber rearward from diffuser case and lower onto pallet. Remove hoist and fixture.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−11



1. REMOVE COMPRESSOR INLET CONE.
2. REMOVE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE.
3. REMOVE HIGH PRESSURE TURBINE.
4. REMOVE TURBINE NOZZLE.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-12

Task 72-00-41-020-012:

1. Remove Diffuser And Combustor (Horizontal)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001).

(2) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(3) Remove 1st Stage LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(4) Remove LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(5) Remove The Low Pressure Compressor. Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(6) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(7) Remove The Low Pressure Turbine With Shaft. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(8) Remove The Fan Case. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-001).

(9) Remove The No. 1 Bearing Support Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(10) Remove The Main Gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001).

(11) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(12) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(13) Remove The No. 3 Bearing Rear Seal Assembly. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

(14) Disconnect/Remove The External Parts To Get Access To The Diffuser And Combustor. Refer to 72-00-41, Removal-02 (Task 72-00-41-020-002).

B. Equipment And Materials

Special Tools:

PWA 28657	Sling
PWA 29389	Pump, Hydraulic
PWA 76154	Adapter (Two Required)
PWA 80187	Multiplier, Torque
PWA 85056	Cover (Optional To PWA 85802)
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85069	Puller
PWA 85071	Puller, Hydraulic
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85390	Adapter
PWA 85428	Protector
PWA 85701	Guide
PWA 85751	Bracket (Two Required)
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85802	Cover
PWA 85893	Support, Cantilever
PWA 85909	Adapter, Support
PWA 85910	Adapter, Support
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 86489	Puller, Jackscrew
PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

C. Procedure

(1) Position PWA 85168 Protector (302/11) smaller end first into diffuser case. See Figure 302.

(2) Remove PWA 85159 Thread Protector (302/3) from rear of HPC rear hub.

(3) Install PWA 85390 Lifting Adapter (302/5) to high compressor 8th stage bleed pads to support the engine during diffuser combustor removal.

(4) Remove the saddle (302/12) and pedestal (302/10) positioned at Flange M of diffuser case.

(5) Install PWA 85893 Support (303/2) in engine. See Figure 303.

  (a) Attach the two tubular handles to ends of support.

  CAUTION: ONLY A MINIMUM AMOUNT OF JACKING OF SUPPORT IS NECESSARY SINCE TOO MUCH JACKING CAN EASILY CAUSE BEARING DAMAGE. TO FIND IF THE LOAD HAS BEEN MOVED FROM THE NO. 3 BEARING SUPPORT TO PWA 85893 SUPPORT THE TOP AND BOTTOM BEARING ROLLERS WILL BE FREE TO ROTATE.

  CAUTION: JACK MUST SUPPORT THE HPC DRIVESHAFT AT 12 O'CLOCK POSITION. DO NOT PERMIT SHAFT TO ROTATE.

  (b) With correct sling and hoist install PWA 85893 Support in engine from front or rear with jack detail of support to the rear of the engine. Insert long aluminum handle through center of engine to guide support in place.

  (c) Install PWA 85909 Adapter (303/1) over the front end of PWA 85893 Support and attach to the intermediate case. Remove the two tubular handles from the support.

  NOTE: If fan hub is installed, use PWA 85910 Adapter as an alternate to PWA 85909 Adapter.

  (d) With a speed handle, extension and socket wrench, operate the jack detail until it contacts ID of HPC shaft.

  (e) Monitor rollers of No. 3 bearing and continue to operate jack until bearing rollers have shown the load has moved from No. 3 bearing to PWA 85893 Support. When support jack has the load, lower the knurled nut to the locking position. Remove speed handle, extension and socket wrench.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT BEARINGS BY STORING IN A SUITABLE CONTAINER.

(6) Remove No. 3 bearing inner race and rollers (302/4), (304/8) using PWA 85071 Hydraulic Puller (302/2), 304/6) and PWA 29389 Hydraulic Pump.

NOTE: Install PWA 85802 Protector Cover or PWA 85056 Protector Cover (302/1) over outer race if the No. 3 bearing outer race is not to be removed.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(7) Remove No. 3 bearing outer race (304/1) - For engines when it is necessary to remove outer race from diffuser and combustor when it is installed on the high pressure compressor. See Figure 304.

NOTE: See 72-41-00, Removal-01 Task 72-41-00-030-004 for the removal of the No. 3 bearing outer race from the diffuser and combustor when it is not installed on the engine.

NOTE: See 72-41-00, Disassembly-03 Task 72-41-00-030-003-001 or 72-41-00, Dissasembly-04 Task 72-41-00-030-003-002 for removal of outer race from the No. 3 bearing duct and housing after the duct and housing has been removed from the diffuser and combustor.

(a) Remove PWA 85168 Protector (304/14).

(b) Install six workbolts, lubricated with Engine Oil P03-001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 - 325 lb-in. (32.766 - 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375-24 by 1.000 inch (25.400 mm) thread length.

(c) Install PWA 85168 Protector (304/14).

(d) Remove rivet (304/4) from retaining nut (304/2) in housing and discard rivet.

(e) With PWA 86491 Driver or PWA 85797 Wrench (304/5), loosen and remove the retaining nut (304/2) from housing.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) − See Figure 304, Sheet 2. With PWA 102743 Torque Adapter (304/15), PWA 102744 Holder Adapter (304/16) and PWA 80187 Torque Multiplier (304/17), loosen and remove the retainer nut (304/2) from the housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(g) With PWA 86489 Puller (304/3), remove the No. 3 bearing outer race (304/1) from housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the outer race.

(h) Remove PWA 85168 Protector (304/14) and the six workbolts from the bearing housing.

(i) Install PWA 85168 Protector (304/14), smaller end first, into diffuser case. Push protector into seat in case.

(8) Remove No. 3 bearing seal spacer (302/7) with (304/11) PWA 85068 Fixture (302/8) and PWA 85069 Puller.

(a) Loosen screws and wing nuts securing jaws.

(b) Position puller over HPC rear hub. Slide jaws behind rear flange of seal spacer. Tighten screws and wing nuts to secure jaws.

(c) Pull fixture by hand to remove spacer.

(d) If spacer cannot be removed by hand, install PWA 85069 Puller to upper flange of fixture per following step.

(e) Retract center jackscrew of PWA 85069 Puller and position puller to upper flange of PWA 85068 Fixture. Secure puller to fixture with detail screws. Using standard wrench, tighten center jackscrew to seat center puck in HPC rear hub. Continue tightening jackscrew to remove seal spacer from tight fit on hub. Remove screws securing puller to fixture. Remove puller.

(f) Loosen screws and wing nuts securing jaws to ring detail of PWA 85068 Fixture. Remove fixture.

(g) Remove seal spacer from HPC rear hub.

(9) Remove No. 3 bearing front seal seat (302/6), (304/10) with PWA 85067 Fixture (302/9), (304/13).

(a) Loosen screws and hand knobs securing jaws to fixture.

(b) Position fixture over HPC rear hub with fixture locating on seal seat. Slide jaws outward to engage pulling flange of seat. Tighten upper screws to secure jaws. Tighten hand knobs to fully engage jaws in pulling groove of seal seat.

(c) Pull fixture by hand to remove seal seat.

(d) If seal seat cannot be removed by hand, install PWA 85069 Puller to upper flange of fixture per following step.

(e) Retract center jackscrew of PWA 85069 Puller and position puller to upper flange of PWA 85067 Fixture. Secure puller to fixture with detail screws. Using standard wrench tighten center jackscrew to seat center puck in HPC rear hub. Continue tightening jackscrew to remove seal seat from tight fit on hub. Remove screws securing puller to fixture. Remove puller.

(f) Loosen screws and hand knobs securing jaws to ring detail of fixture. Remove fixture.

(g) Remove seal seat from HPC rear hub.

(10) Install two PWA 85751 Handling Brackets to diffuser case. See Figure 305.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

(11) Install two PWA 76154 Adapters to spools on PWA 85751 Handling Brackets and attach PWA 28657 Sling and overhead hoist to PWA 76154 Adapters.

(12) Position PWA 85308 Guide or PWA 85701 Guide, larger end first, over HPC rear hub. Seat on rear hub seal plate shoulder.

(13) Remove the Flange K hardware as follows. Refer to 72−00−41, Removal−20 (Task 72−00−41−020−020).

(14) Using 0.250−28 jackscrews to separate Flange K, carefully move diffuser combustor assembly rearward to clear engine and place front end down on pallet.

(15) Remove gasket from rear flange of HPC rear case if equipped (Post SB PW4ENG 72−48).

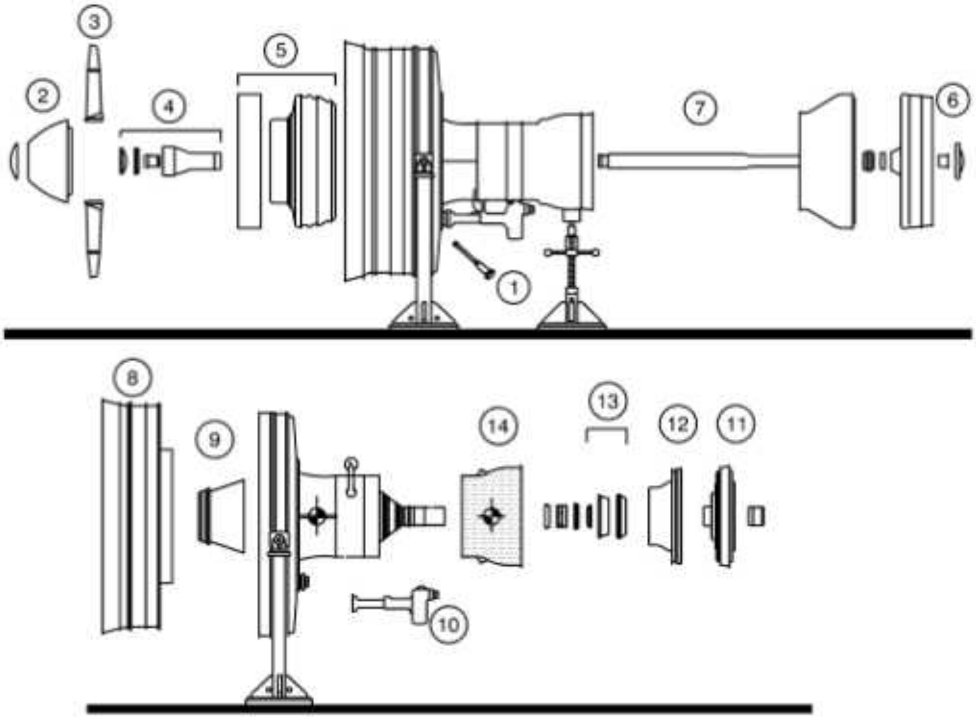
(16) Remove PWA 28657 Sling and PWA 76154 Adapters, from PWA 85045 Handling Brackets.

(17) Remove PWA 85751 Handling Brackets from diffuser case.

(18) Remove PWA 85308 Guide from HPC rear hub.

(19) Install PWA 85428 Protector over No. 3 bearing rear knife−edge on HPC rear hub.

(20) Install PWA 85159 Protector over threads and splines on HPC rear hub.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE TURBINE EXHAUST CASE.
7. REMOVE LOW PRESSURE TURBINE (LPT).
8. REMOVE FAN CASE.
9. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
10. REMOVE MAIN GEARBOX.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
14. REMOVE DIFFUSER AND COMBUSTER

(Task 72−00−41−020−012)

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-12

Task 72-00-41-020-013:

1. Remove Diffuser And Combustor (Horizontal)

NOTE: See Figure 301 for part/assembly removal procedure sequence.

A. Prerequisites

(1) Remove The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Removal-03 (Task 72-00-34-050-001).

(2) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(3) Remove 1st Stage LPC Blade Assemblies. Refer to 72-00-31, Removal-04 (Task 72-00-31-020-002-002).

(4) Remove LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(5) Remove The Low Pressure Compressor. Refer to 72-00-31, Removal-01 (Task 72-00-31-020-003).

(6) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(7) Remove The Low Pressure Turbine With Shaft. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(8) Remove The Fan Case. Refer to 72-00-33, Removal-01 (Task 72-00-33-020-006).

(9) Remove The No. 1 Bearing Support Assembly. Refer to 72-00-34, Removal-04 (Task 72-00-34-050-002).

(10) Remove The Main Gearbox. Refer to 72-00-61, Removal-01 (Task 72-00-61-020-001).

(11) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(12) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(13) Remove No. 3 Bearing Rear Seal Assembly. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

(14) Disconnect/Remove External Parts To Gain Access To The Diffuser And Combustor. Refer to 72−00−41, Removal−02 Task 72−00−41−020−006.

PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

C. Procedure

(1) Install the PWA 85168 Protector (302/11) smaller end first into the diffuser case. See Figure 302.

(2) Remove the PWA 85159 Thread Protector (302/3) from the rear of the HPC rear hub.

(3) Install the PWA 85390 Lifting Adapter (302/5) to the high compressor 8th stage bleed pads to support the engine during diffuser combustor removal.

(4) Remove the saddle (302/12) and pedestal (302/10) installed at Flange M of the diffuser case.

(5) Install the PWA 85893 Support (303/2) in the engine. See Figure 303.

  (a) Attach the two tubular handles to the ends of the support.

  CAUTION: ONLY A MINIMUM AMOUNT OF JACKING OF SUPPORT IS NECESSARY SINCE TOO MUCH JACKING CAN EASILY CAUSE BEARING DAMAGE. TO FIND IF THE LOAD HAS BEEN MOVED FROM THE NO. 3 BEARING SUPPORT TO PWA 85893 SUPPORT THE TOP AND BOTTOM BEARING ROLLERS WILL BE FREE TO ROTATE.

  CAUTION: JACK MUST SUPPORT THE HPC DRIVESHAFT AT 12 O'CLOCK POSITION. DO NOT PERMIT SHAFT TO ROTATE.

  (b) With correct sling and hoist install PWA 85893 Support into the engine from the front or rear with the jack detail of the support to the rear of the engine. Insert long aluminum handle through center of engine to guide support in place.

  (c) Install the PWA 85909 Adapter (303/1) over the front end of the PWA 85893 Support and attach to the intermediate case. Remove the two tubular handles from the support.

  NOTE: If the fan hub is installed, use PWA 85910 Adapter as an alternate to PWA 85909 Adapter.

  (d) With a speed handle, extension and socket wrench, operate the jack detail until it contacts the ID of the HPC shaft.

  (e) Monitor the rollers of the No. 3 bearing and continue to operate the jack until the bearing rollers have shown the load has moved from the No. 3 bearing to the PWA 85893 Support. When the support jack has the load, lower the knurled nut to the locking position. Remove speed handle, extension and socket wrench.

CAUTION: TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT BEARINGS BY STORAGE IN AN APPLICABLE CONTAINER.

(6) Remove the No. 3 bearing inner race and rollers (302/4), (304/8) use the PWA 85071 Hydraulic Puller (302/2), (304/6) and PWA 29389 Hydraulic Pump.

NOTE: Install the PWA 85802 Protector Cover or PWA 85056 Protector Cover (302/1) over the outer race if the No. 3 bearing outer race will not be removed.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(7) Remove the No. 3 bearing outer race (304/1) − For engines when it is necessary to remove the outer race from the diffuser and combustor when it is installed on the high pressure compressor. See Figure 304.

NOTE: See 72−41−00, Removal−01 Task 72−41−00−030−004 for the removal of the No. 3 bearing outer race from the diffuser and combustor when it is not installed on the engine.

NOTE: See 72−41−00, Disassembly−03 Task 72−41−00−030−003−001 or Dissasembly−04 Task 72−41−00−030−003−002 for removal of outer race from the No. 3 bearing duct and housing after the duct and housing has been removed from the diffuser and combustor.

(a) Remove the PWA 85168 Protector (304/14).

(b) Install six workbolts, lubricated with Engine Oil P03−001, into the bearing housing channel nuts equally around the housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(c) Install the PWA 85168 Protector (304/14).

(d) Remove the rivet (304/4) from the retaining nut (304/2) in the housing and discard the rivet.

(e) With the PWA 86491 Wrench or PWA 85797 Wrench (304/5), loosen and remove the retaining nut (304/2) from the housing.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) − See Figure 304, Sheet 2. With PWA 102743 Torque Adapter (304/15), PWA 102744 Holder Adapter (304/16) and PWA 80187 Torque Multiplier (304/17), loosen and remove the retaining nut (304/2) from the housing.

CAUTION: TO PREVENT BEARING DAMAGE, WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING OUTER RACE.

(g) With the PWA 86489 Puller 304/3), remove the No. 3 bearing outer race (304/1) from the housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the outer race.

(h) Remove the PWA 85168 Protector (304/14) and the six workbolts from the bearing housing.

(i) Install PWA 85168 Protector (304/14), smaller end first, into the diffuser case. Push the protector into the case.

(8) Remove the No. 3 bearing seal spacer (302/7) with (304/11) the PWA 85068 Fixture (302/8) and PWA 85069 Puller.

(a) Loosen the screws and wing nuts that attach the jaws.

(b) Install the puller over the HPC rear hub. Move the jaws behind the rear flange of the seal spacer. Tighten the screws and wing nuts to attach the jaws.

(c) Pull the fixture by hand to remove the spacer.

(d) If the spacer cannot be removed by hand, install PWA 85069 Puller to the upper flange of the fixture by the steps that follow.

1 Retract the center jackscrew of the PWA 85069 Puller and install the puller to the upper flange of the PWA 85068 Fixture. Attach the puller to the fixture with the detail screws. Use a standard wrench and tighten the center jackscrew to engage the center puck in the HPC rear hub. Continue to tighten the jackscrew to remove the seal spacer from the tight fit on the hub. Remove the screws that attach the puller to the fixture. Remove the puller.

2 Loosen the screws and wing nuts that attach the jaws to the ring detail of the PWA 85068 Fixture. Remove the fixture.

3 Remove the seal spacer from the HPC rear hub.

(9) Remove the No. 3 bearing front seal seat (302/6), (304/10) with the PWA 85067 Fixture (302/9), (304/13).

(a) Loosen the screws and hand knobs that attach the jaws to the fixture.

(b) Install the fixture over the HPC rear hub with the fixture on seal seat. Move the jaws outward to engage the pulling flange of the seat. Tighten the upper screws to attach the jaws. Tighten the hand knobs to fully engage the jaws in the pulling groove of the seal seat.

(c) Pull the fixture by hand to remove the seal seat.

(d) If seal seat cannot be removed by hand, install PWA 85069 Puller to the upper flange of the fixture by the steps that follow.

1 Retract the center jackscrew of the PWA 85069 Puller and install the puller to the upper flange of the PWA 85067 Fixture. Attach the puller to the fixture with detail screws. Use a standard wrench and tighten the center jackscrew to engage the center puck in the HPC rear hub. Continue to tighten the jackscrew to remove the seal seat from the tight fit on the hub. Remove the screws that attach the puller to the fixture. Remove the puller.

2 Loosen the screws and hand knobs that attach the jaws to the ring detail of the fixture. Remove the fixture.

3 Remove the seal seat from the HPC rear hub.

(10) Install two PWA 85751 Handling Brackets to the diffuser case. See Figure 305.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations, install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of the diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket in the rear most two holes as marked on the bracket.

(11) Install two PWA 76154 Adapters to the spools on PWA 85751 Handling Brackets and attach the PWA 28657 Sling and overhead hoist to the PWA 76154 Adapters.

(12) Install the PWA 85308 Guide or PWA 85701 Guide, larger end first, over the HPC rear hub to engage on the rear hub seal plate shoulder.

(13) Remove the Flange K Hardware as follows. Refer to 72−00−41, Removal−20 (Task 72−00−41−020−020).

(14) Use 0.250−28 jackscrews to separate Flange K, carefully move the diffuser combustor assembly rearward to clear the engine and put front end down on a pallet.

(15) Remove the gasket from the rear flange of the HPC rear case.

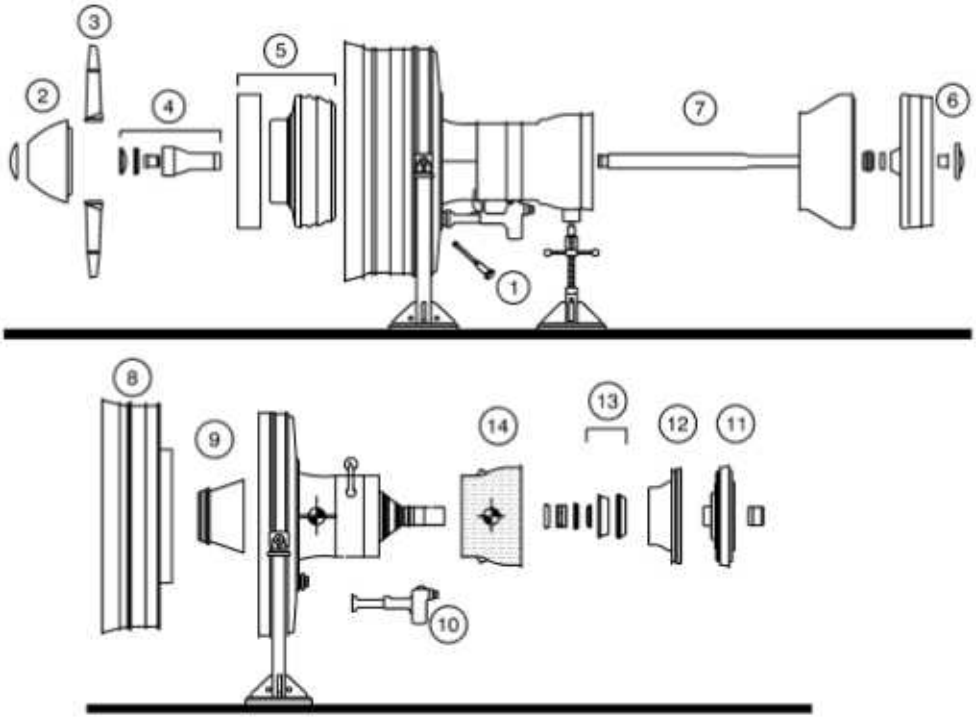
(16) Remove the PWA 28657 Sling and PWA 76154 Adapters, from the PWA 85045 Handling Brackets.

(17) Remove the PWA 85751 Handling Brackets from the diffuser case.

(18) Remove the PWA 85308 Guide from the HPC rear hub.

(19) Install the PWA 85428 Protector over the No. 3 bearing rear knife−edge on the HPC rear hub.

(20) Install the PWA 85159 Protector over the threads and splines on the HPC rear hub.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE TURBINE EXHAUST CASE.
7. REMOVE LOW PRESSURE TURBINE (LPT).
8. REMOVE FAN CASE.
9. REMOVE NO. 1 BEARING SUPPORT ASSEMBLY.
10. REMOVE MAIN GEARBOX.
11. REMOVE HIGH PRESSURE TURBINE (HPT).
12. REMOVE TURBINE NOZZLE.
13. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
14. REMOVE DIFFUSER AND COMBUSTER

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-13

Task 72-00-41-050-006:

1. Remove Fuel Injector And Support

A. Prerequisites

(1) To gain access to fuel injectors No. 16 and 17, remove oil tank per 72-00-61, Removal-28 (Task 72-00-61-050-012).

(2) To gain access to fuel injector No. 20, remove (upper left) turbine cooling tube (AP04) per 72-00-52, Removal-07 Task 72-00-53-050-004.

(3) To gain access to fuel injector No. 7, remove (lower right) turbine cooling tube (AP02) per 72-00-52, Removal-07 Task 72-00-53-050-004.

B. Equipment And Materials Required - None

C. Procedure
See Figure 301, Figure 302, Figure 303, Figure 304, and Figure 305.

(1) If access to injector No. 22 is required, remove (left) diffuser seal air vent tube (AP22) as follows. See Figure 302.

(a) Remove lockwire and disconnect tube nut from diffuser case internal tube at approximately 11 o'clock position.

(b) Loosen bolts, nuts, and clamps securing tubes to bracket attached to forward end of tube.

(c) Remove lockwire and bolts securing tube elbow and bracket to HPC rear case.

(d) Remove bolt, nut, and clamp securing tube to bracket at No. 21 fuel injector.

(e) (Pre SB PW4ENG 72-567) Remove tube from engine and remove deflector from HPC case. Remove and discard gaskets. Install protective closures.

CAUTION: (POST SB PW4ENG 72-567) WHEN YOU REMOVE THE (AP22) LEFT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE

DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(f) (Post SB PW4ENG 72−567) Remove the bolt, nut and clamp that attach the tube to a fuel injector bracket. Remove the tube from the engine. Remove the deflector from the recessed area of the diffuser case pad. Remove and discard the gaskets from the tube flanged end and from the diffuser case pad. Remove the tube locks and gaskets from the diffuser case pad and install protective covers.

(2) If access to injector No. 12 is required, remove lower right turbine blade cooling air tube (AP37) as follows. See Figure 303.

(a) Remove lockwire, ten bolts, and bracket securing tube flange to diffuser case at approximately 5 o'clock position.

(b) Remove bolt, nut, and clamp securing fuel injector supply manifold to bracket. Remove bracket.

(c) Remove bolts and bracket securing tube flange to air shutoff valve on HPC case.

(d) Remove bolts, nuts, and clamps securing tube to diffuser case brackets and remove tube from engine.

(e) (Pre SB PW4ENG 72−572 or SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(f) (Post SB PW4ENG 72−572 and Pre SB PW4ENG 72−627 or Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−13

(3) If access to injector No. 13 is required, remove No. 3 bearing oil scavenge manifold (LR04). See Figure 304.

(a) (Pre SB PW4ENG 79−46) Remove nut, bolt and clamp securing manifold (LR04) to the oil pump bracket. Manifold (LR05) is also secured to this bracket with the same nut and bolt. See Figure 304 (Sheet 1).

(b) (Post SB PW4ENG 79−46 and Pre SB PW4ENG 79−75) Remove nut, bolt and clamp securing manifold (LR04) to the oil pump bracket. Manifold (LR05) is also secured to this bracket with the same nut and bolt. Also remove the additional nut, bolt, grommet halves and clamp on (LR04) manifold where it is clamped to the the (LR05) manifold. See Figure 304 (Sheet 2).

(c) (Post SB PW4ENG 79−75) Remove nuts, bolts and clamps securing the hose and manifold assembly (LR04) to the fluid pressure dampener or (Post SB PW4ENG 79−86) adapter bracket and to the bracket mounted between fuel injector pads 12 and 13. Remove the bracket installed between fuel injector pads 12 and 13. See Figure 304 (Sheets 3 through 6).

(d) Remove lockwire and disconnect diffuser case internal tube nut from manifold elbow at 6 o'clock position.

(e) Remove bolts securing manifold to main oil pump. Remove manifold from engine.

NOTE: Catch oil in container with a capacity of 5 U.S. gallons (19 liters).

(f) Remove and discard packing. Install protective closures.

(4) Remove lockwire and disconnect fuel supply tube from fuel injector supply manifold. See Figure 301.

NOTE: A small amount of fuel will drain from injectors. Be prepared to catch fuel in suitable container.

(5) Remove lockwire and disconnect fuel injector supply manifold nuts from injector being removed and from two adjacent injectors supplied from same manifold. Remove manifold and transfer tube. Discard packings. See Figure 301.

(6) Remove lockwire and bolts securing injector being removed. Remove injector, gasket, and bracket (if applicable). Discard gasket. See Figure 301 and Figure 305.

NOTE: Rotate and/or tilt injector as required to disengage injector from diffuser case. Mark location of removed injectors and brackets to facilitate reassembly.

(7) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Fuel Injector Component Maintenance Manual, 73−11−11 (P&W Manual PN 50A446).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−13

Task 72−00−41−050−008:

1. Remove Fuel Injector And Support

A. Prerequisites

(1) To gain access to fuel injectors No. 16 and 17, remove oil tank by 72−00−61, Removal−28 Task 72−00−61−050−012.

(2) To gain access to fuel injector No. 20, remove (upper left) turbine cooling tube (AP04) by 72−00−52, Removal−07 Task 72−00−53−050−004.

(3) To gain access to fuel injector No. 7, remove (lower right) turbine cooling tube (AP02) by 72−00−52, Removal−07 Task 72−00−53−050−004.

B. Equipment And Materials Required − None

C. Procedure
See Figure 301, Figure 302, Figure 303, Figure 304 and Figure 305.

(1) If access to injector No. 22 is necessary, remove the diffuser seal air vent tube assembly (AP22) as follows. See Figure 302.

(a) Remove the lockwire and the bolts that attach the tube to a diffuser case pad at approximately the 11 o'clock position.

(b) (If not removed before) Remove the bolt, nut and clamp from the No. 3 bearing breather tube (LB03) that is attached to the bracket on the diffuser case pad with tube assembly (AP22). Remove the bracket.

(c) Remove the bolts, nuts and clamps that attach the PT4.95 tube (AS01) and the air shutoff valve signal tube (AA76) to the bracket attached to the upper flange end of the tube. Remove the lockwire, bolts and bracket that attach the tube to HPC rear case.

CAUTION: WHEN YOU REMOVE THE (AP22) LEFT SIDE TUBE LOCK FROM THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY, YOU MUST BE CAREFUL THAT THE AIR VENT TUBE DOES NOT FALL INTO THE DIFFUSER CASE. AS A PRECAUTION, ATTACH A TEMPORARY SAFETY

WIRE AROUND THE INTERNAL DIFFUSER SEAL AIR VENT TUBE ASSEMBLY SO IT WILL NOT FALL INTO THE DIFFUSER CASE. IF THE AIR VENT TUBE FALLS INTO THE DIFFUSER CASE IT IS POSSIBLE THAT MORE ENGINE DISASSEMBLY WILL BE NECESSARY TO GET ACCESS TO REMOVE THE TUBE.

(d) Remove the bolt, nut and clamp that attach the tube to a fuel injector bracket. Remove the tube from the engine. Remove the deflector assembly from the recessed area of the flanged end (with four holes) of the tube. Remove the tube locks from the engine. Remove and discard the gaskets. Install protection covers.

(2) If access to injector No. 12 is required, remove lower right turbine blade cooling air tube (AP37) as follows. See Figure 303.

(a) Remove lockwire, ten bolts, and bracket securing tube flange to diffuser case at approximately 5 o'clock position.

(b) Remove bolt, nut, and clamp securing fuel injector supply manifold to bracket. Remove bracket.

(c) Remove bolts and bracket securing tube flange to air shutoff valve on HPC case.

(d) Remove bolts, nuts, and clamps securing tube to diffuser case brackets.

(e) (Pre SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(f) (Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

(3) If access to injector No. 13 is required, remove No. 3 bearing oil scavenge manifold (LR04). See Figure 304.

(a) (Pre SB PW4ENG 79−46) Remove nut, bolt and clamp securing manifold (LR04) to the oil pump bracket. Manifold (LR05) is also secured to this bracket with the same nut and bolt. See Figure 304 (Sheet 1).

(b) (Post SB PW4ENG 79−46 and Pre SB PW4ENG 79−75) Remove nut, bolt and clamp securing manifold (LR04) to the oil pump bracket. Manifold (LR05) is also secured to this bracket with the same nut and bolt. Also remove the additional nut, bolt, grommet halves and clamp on (LR04) manifold where it is clamped to the the (LR05) manifold. See Figure 304 (Sheet 2).

(c) (Post SB PW4ENG 79−75) Remove nuts, bolts and clamps securing the hose and manifold assembly (LR04) to the fluid pressure dampener or (Post SB PW4ENG 79−86) adapter bracket and to the bracket mounted between fuel injector pads 12 and 13. Remove the bracket installed between fuel injector pads 12 and 13. See Figure 304 (Sheets 3 through 6).

(d) Remove lockwire and disconnect diffuser case internal tube nut from manifold elbow at 6 o'clock position.

(e) Remove bolts securing manifold to main oil pump. Remove manifold from engine.

NOTE: Catch oil in container with a capacity of 5 U.S. gallons (19 liters).

(f) Remove and discard packing. Install protective closures.

(4) Remove lockwire and disconnect fuel supply tube from fuel injector supply manifold. See Figure 301.

NOTE: A small amount of fuel will drain from injectors. Be prepared to catch fuel in suitable container.

(5) Remove lockwire and disconnect fuel injector supply manifold nuts from injector being removed and from two adjacent injectors supplied from same manifold. Remove manifold and transfer tube. Discard packings. See Figure 301.

(6) Remove lockwire and bolts securing injector being removed. Remove injector, gasket, and bracket (if applicable). Discard gasket. See Figure 301 and Figure 305.

NOTE: Rotate and/or tilt injector as required to disengage injector from diffuser case. Mark location of removed injectors and brackets to facilitate reassembly.

(7) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component, see Fuel Injector Component Maintenance Manual, 73−11−11 (P&W Manual PN 50A446).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-14

Task 72-00-41-050-007:

1. Remove Igniter Plug And Igniter Plug Boss

A. General

(1) This procedure applies to both igniter plug locations. If boss or spacer(s) are to be replaced, and parts removed at disassembly are not available, igniter plug immersion depth must be determined using this procedure. If none of the above parts are to be replaced, remove igniter plug per Removal-07 Task 72-00-41-050-004.

(2) If boss or spacer(s) are to be replaced, and parts removed at disassembly are available, check boss and spacer thickness per Installation-08 Task 72-00-41-450-005.

B. Equipment And Materials Required - None

C. Procedure
See Figure 301.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Loosen clamp (301/7) securing heat shield segments (301/5, 301/6) at igniter plug (301/4). Slide clamp back on igniter cable (301/8) and remove heat shields. Clamp may remain on cable.

(2) Disconnect cable from igniter plug and touch plug casing with cable end (contact) to dissipate any residual electrical charge.

(3) Remove grommet from plug end of cable and discard.

(4) Install protective closure on cable end.

(5) Remove plug from its boss (301/2) on diffuser case.

NOTE: Hold boss with wrench to prevent boss from turning while removing plug.

NOTE: For additional information concerning detailed maintenance of this component, see Igniter Plug Component Maintenance Manual 74−22−01, (PW Manual PN 771346).

(6) Unbend tabs on key washer (301/3). Remove and discard key washer.

(7) Remove lockwire, boss, and spacer(s) (301/1) from diffuser case.

1. Remove Diffuser And Combustor − Unassigned

This Removal−15 Is Unassigned

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − REMOVAL−16

Task 72−00−41−040−000:

1. Remove Diffuser And Combustor − Unassigned

This Removal−16 Is Unassigned

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-17

Task 72-00-41-040-001:

1. Remove No. 3 Bearing (Vertical)

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(2) Remove The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

(3) Trunnion The Fan Cases Through HPT From Horizontal To Front End Down Position. Refer to 72-00-00, Special Procedures-12 (Task 72-00-00-020-003).

(4) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-08 (Task 72-00-52-020-002).

(5) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-02 (Task 72-00-51-020-002).

(6) Remove The No. 3 Bearing Rear Seal Assembly And Rear Seal Seat. Refer to 72-00-41, Removal-09 (Task 72-00-41-020-004).

B. Equipment And Materials Required

Special Tools:

PWA 29389	Pump, Hydraulic
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85069	Puller, Jackscrew
PWA 85071	Puller, Hydraulic
PWA 85159	Protector
PWA 85168	Protector
PWA 85797	Wrench (Optional To PWA 86491)
PWA 86489	Puller, Jackscrew
PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03−001	Engine Oil (PWA 521B)

C. Procedure

(1) Position PWA 85168 Protector (302/14), smaller end first, into diffuser case. Push protector down to seat in case.

(2) Remove PWA 85159 Thread Protector (302/2) from rear of HPC rear hub. See Figure 302.

(3) Remove No. 3 bearing inner race and rollers (302/3), with PWA 85071 Puller (302/1) as follows.

(a) Retract hydraulic cylinder ram as required. Remove jaw retaining ring of puller.

(b) Position puller over HPC rear hub (302/13) and engage jaws with puller groove in No. 3 bearing inner race. Position retaining ring over jaws and seat on flange of jaws. Secure retaining ring with knurled screw.

(c) Connect PWA 29389 Hydraulic Pump to hydraulic cylinder.

(d) Actuate hydraulic pump to separate inner race from tight fit on hub.

(e) Remove hydraulic pump. Remove retaining ring securing jaws. Remove puller from engine.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT BEARINGS BY STORING IN A SUITABLE CONTAINER.

(f) Remove bearing inner race and rollers from HPC rear hub and place in suitable labeled container.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(4) Remove No. 3 bearing outer race (302/8) from bearing housing as follows.

(a) Remove PWA 85168 Protector (302/14).

(b) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(c) Install PWA 85168 Protector (302/14).

(d) Remove rivet (302/5) from retaining nut (302/6) in housing and discard rivet.

(e) With PWA 86491 Driver or PWA 85797 Wrench (302/4), loosen and remove the retaining nut (302/6) from housing.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) − See Figure 302, Sheet 2. With PWA 102743 Torque Adapter (302/17), PWA 102744 Holder Adapter (302/16) and PWA 80187 Torque Multiplier (302/15), loosen and remove the retaining nut (302/6) from the housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(g) With PWA 86489 Puller (302/7), remove the No. 3 bearing outer race (302/8) from housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the bearing outer race.

(h) Remove PWA 85168 Protector (302/14) and the six workbolts from the bearing housing.

(i) Install PWA 85168 Protector (302/14), smaller end first, into diffuser case. Push protector down to seat in case.

NOTE: Removal of the seal seat and spacer will make sure that you get an accurate reading, when you take the measurements for the seating of the No. 3 bearing.

(5) Remove the No. 3 bearing seal spacer (302/10) with a PWA 85068 Fixture (302/9) as follows.

(a) Loosen the screws and wing nuts which secure the jaws.

(b) Position puller over the HPC rear hub. Slide jaws behind the rear flange of seal spacer. Tighten the screws and wing nuts to secure the jaws.

(c) Pull the fixture by hand to remove the spacer.

(d) If the spacer cannot be removed by hand, install a PWA 85069 Puller to upper flange of fixture per the following step.

(e) Retract the center jackscrew of PWA 85069 Puller and position the puller to upper flange of the PWA 85068 Fixture. Secure the puller to fixture with detail screws. Using standard wrench, tighten the center jackscrew to seat the center puck into the HPC rear hub. Continue tightening jackscrew to remove the seal spacer from a tight fit on the hub. Remove the screws which secure the puller to fixture. Remove the puller.

(f) Loosen the screws and wing nuts which secure the jaws to the ring detail of the PWA 85068 Fixture. Remove the fixture.

(g) Remove the seal spacer from the HPC rear hub.

(6) Remove the No. 3 bearing front seal seat (302/12) with a PWA 85067 Fixture (302/11) as follows.

(a) Loosen the screws and hand knobs which secure the jaws to the fixture.

(b) Position the fixture over HPC rear hub with the fixture located on the seal seat. Slide the jaws outward to engage the pulling flange of the seat. Tighten the upper screws to secure jaws. Tighten the hand knobs to fully engage jaws in the pull groove of the seal seat.

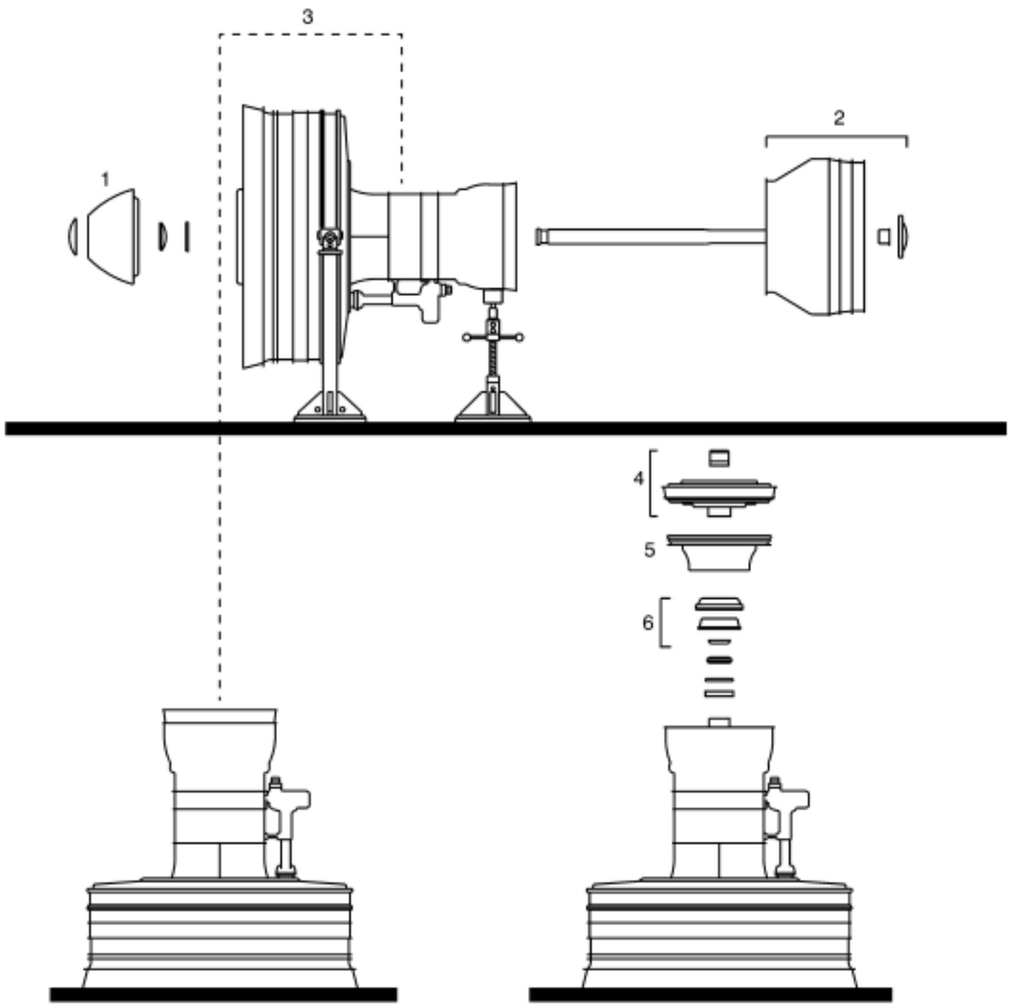
(c) Pull the fixture by hand to remove seal seat.

(d) If the seal seat cannot be removed by hand, install a PWA 85069 Puller to the upper flange of fixture per the following step.

(e) Retract the center jackscrew of PWA 85069 Puller and position the puller to the upper flange of the PWA 85067 Fixture. Secure the puller to fixture with the detail screws. Using a standard wrench tighten the center jackscrew to seat the center puck into the HPC rear hub. Continue tightening jackscrew to remove the seal seat from a tight fit on the hub. Remove the screws which secure the puller to fixture. Remove the puller.

(f) Loosen the screws and hand knobs which secure the jaws to the ring detail of fixture. Remove the fixture.

(g) Remove the seal seat from the HPC rear hub.



1. REMOVE COMPRESSOR INLET CONE.
2. REMOVE LPT/TEC WITH SHAFT.
3. TRUNNION FAN CASES THROUGH HPT TO FRONT END DOWN.
4. REMOVE HIGH PRESSURE TURBINE (HPT).
5. REMOVE TURBINE NOZZLE.
6. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - REMOVAL-18

Task 72-00-41-040-002:

1. Remove No. 3 Bearing (Horizontal)

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(2) Remove The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Removal-01 (Task 72-00-32-020-001).

(3) Remove The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

(4) Remove The High Pressure Turbine. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

(5) Remove The Turbine Nozzle. Refer to 72-00-51, Removal-01 (Task 72-00-51-020-001).

(6) Remove The No. 3 Bearing Rear Seal Assembly And Rear Seal Seat. Refer to 72-00-41, Removal-03 (Task 72-00-41-020-003).

B. Equipment And Materials Required

Special Tools:

PWA 29389	Pump, Hydraulic
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85069	Puller, Jackscrew
PWA 85071	Puller, Hydraulic
PWA 85159	Protector
PWA 85168	Protector
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85893	Support, Cantilever
PWA 85910	Adapter, Support
PWA 86489	Puller, Jackscrew
PWA 86491	Driver, Torque
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03−001	Engine Oil (PWA 521B)

C. Procedure

(1) Position PWA 85168 Protector (302/9), smaller end first, into diffuser case. See Figure 302.

(2) Remove PWA 85159 Thread Protector (302/7) from rear of HPC rear hub. See Figure 302.

(3) Install PWA 85893 Support (303/2) in engines as follows: See Figure 303.

(a) Attach the two tubular handles to end of support.

CAUTION: ONLY A MINIMUM AMOUNT OF JACKING OF SUPPORT IS NECESSARY SINCE TOO MUCH JACKING CAN EASILY CAUSE BEARING DAMAGE. TO FIND IF THE LOAD HAS BEEN MOVED FROM THIS NO. 3 BEARING SUPPORT TO PWA 85393 SUPPORT THE TOP AND BOTTOM BEARING ROLLERS WILL BE FREE TO ROTATE.

CAUTION: JACK MUST SUPPORT THE HPC DRIVESHAFT AT 12 O'CLOCK POSITION. DO NOT PERMIT SHAFT TO ROTATE.

(b) With correct sling and hoist install PWA 85893 Support in engine from front or rear with jack detail of support to the rear of the engine. Insert long aluminum handle through center of engine to guide support in place.

(c) Install PWA 85910 Adapter (303/1) over the front end of PWA 85893 Support and locate in front fan hub ID. Secure PWA 85910 Adapter with the fan hub locknut.

(d) With a speed handle, extension and socket wrench, operate the jack detail until it contacts ID of HPC shaft.

(e) Monitor rollers of No. 3 bearing and continue to operate jack until bearing rollers have shown the load has moved from No. 3 bearing to PWA 85893 Support. When support jack has the load, lower the knurled nut to the locking position. Remove speed handle, extension and socket wrench.

(4) Remove No. 3 bearing inner race and rollers (302/8), with PWA 85071 Puller (302/6).

(a) Retract hydraulic cylinder ram as required. Remove jaw retaining ring of puller.

(b) Position puller over HPC rear hub and engage jaws with puller groove in No. 3 bearing inner race. Position retaining ring over jaws and seat on flange of jaws. Secure retaining ring with knurled screw.

(c) Connect PWA 29389 Hydraulic Pump to hydraulic cylinder.

(d) Actuate hydraulic pump to separate inner race from tight fit on hub.

(e) Remove hydraulic pump. Remove retaining ring securing jaws. Remove puller from engine.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: DETAIL PARTS OF BEARINGS MUST BE KEPT IN THEIR ORIGINAL ASSEMBLIES. PROTECT BEARINGS BY STORING IN A SUITABLE CONTAINER.

(f) Remove bearing inner race and rolls from HPC rear hub and place in suitable labeled container.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE PW4000 SERIES CIR, PN 51A357.

(5) Remove No. 3 bearing outer race (302/1) from bearing housing as follows.

(a) Remove PWA 85168 Protector (302/9).

(b) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(c) Install PWA 85168 Protector (302/9).

(d) Remove rivet (302/4) from retaining nut (302/2) in housing and discard rivet.

(e) With PWA 86491 Driver or PWA 85797 Wrench (302/5), loosen and remove the retaining nut (302/2) from housing.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(f) Mechanical Wrench Method (Optional) − See Figure 302, Sheet 2. With PWA 102743 Torque Adapter (302/14), PWA 102744 Holder Adapter (302/15) and PWA 80187 Torque Multiplier (302/16), loosen the retaining nut (302/2) from the housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(g) With PWA 86489 Puller (302/3), remove the No. 3 bearing outer race (302/1) from housing as follows.

1 Turn the large hex head cap screw clockwise, the full length of its travel.

2 Turn the three hand knobs counterclockwise, the full length of their travel.

3 Put the puller into position until it touches the bearing housing. Also, the jaws must align with the scallops in the bearing housing.

4 Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

5 Turn the large hex head cap screw counterclockwise until the outer race is loose.

6 Remove the puller. Remove the bearing outer race.

(h) Remove PWA 85168 Protector (302/9) and the six workbolts from the bearing housing.

(i) Install PWA 85168 Protector (302/9), smaller end first, into diffuser case.

NOTE: Removal of the seal seat and spacer will make sure that you get an accurate reading, when you take the measurements for the seating of the No. 3 bearing.

(6) Remove the No. 3 bearing seal spacer (302/11) with a PWA 85068 Fixture (302/12) as follows.

(a) Loosen the screws and wing nuts which secure the jaws.

(b) Position puller over the HPC rear hub. Slide jaws behind the rear flange of seal spacer. Tighten the screws and wing nuts to secure the jaws.

(c) Pull the fixture by hand to remove the spacer.

(d) If the spacer cannot be removed by hand, install a PWA 85069 Puller to upper flange of fixture per the following step.

(e) Retract the center jackscrew of PWA 85069 Puller and position the puller to upper flange of the PWA 85068 Fixture. Secure the puller to fixture with detail screws. Using standard wrench, tighten the center jackscrew to seat the center puck into the HPC rear hub. Continue tightening jackscrew to remove the seal spacer from a tight fit on the hub. Remove the screws which secure the puller to fixture. Remove the puller.

(f) Loosen the screws and wing nuts which secure the jaws to the ring detail of the PWA 85068 Fixture. Remove the fixture.

(g) Remove the seal spacer from the HPC rear hub.

(7) Remove the No. 3 bearing front seal seat (302/10) with a PWA 85067 Fixture (302/13) as follows.

(a) Loosen the screws and hand knobs which secure the jaws to the fixture.

(b) Position the fixture over HPC rear hub with the fixture located on the seal seat. Slide the jaws outward to engage the pulling flange of the seat. Tighten the upper screws to secure jaws. Tighten the hand knobs to fully engage jaws in the pull groove of the seal seat.

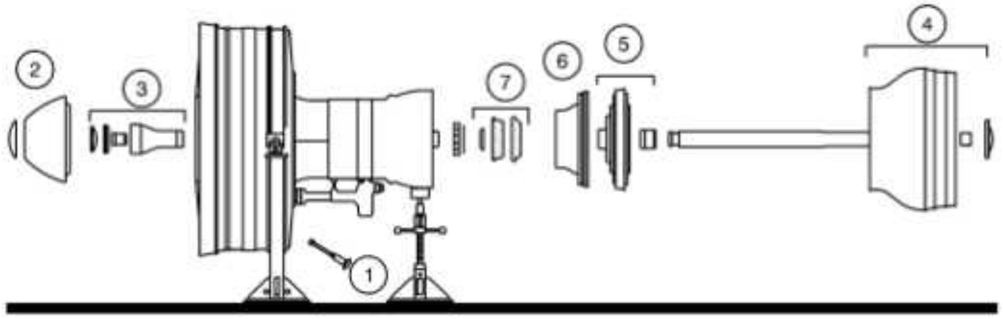
(c) Pull the fixture by hand to remove seal seat.

(d) If the seal seat cannot be removed by hand, install a PWA 85069 Puller to the upper flange of fixture per the following step.

(e) Retract the center jackscrew of PWA 85069 Puller and position the puller to the upper flange of the PWA 85067 Fixture. Secure the puller to fixture with the detail screws. Using a standard wrench tighten the center jackscrew to seat the center puck into the HPC rear hub. Continue tightening jackscrew to remove the seal seat from a tight fit on the hub. Remove the screws which secure the puller to fixture. Remove the puller.

(f) Loosen the screws and hand knobs which secure the jaws to the ring detail of fixture. Remove the fixture.

(g) Remove the seal seat from the HPC rear hub.



1. REMOVE N1 SPEED SENSOR
2. REMOVE COMPRESSOR INLET CONE
3. REMOVE LPC/LPT COUPLING ASSEMBLY
4. REMOVE LPT/TEC WITH SHAFT
5. REMOVE HIGH PRESSURE TURBINE (HPT)
6. REMOVE TURBINE NOZZLE
7. REMOVE NO. 3 BEARING REAR SEAL ASSEMBLY

ENGINE GENERAL – DIFFUSER AND COMBUSTOR – REMOVAL-20

Task 72-00-41-020-020:

1. Remove The Flange K Brackets And Hardware

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Remove the Flange K brackets as follows: See Figure 301.

         (a) Tag and identify the flange M hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove the lockwire, nuts and bolts, which attach the brackets at Flange K.

         (c) Remove two bolts and nut securing fuel flow divider valve bracket to Flange J bracket. Remove remaining bolts and nuts securing Flange K.

Task 72-00-41-420-001:

1. Install Diffuser And Combustor (Vertical) With No. 3 Bearing Outer Race Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-15 Task 72-00-41-420-013 for alternate procedure requiring installation of No. 3 bearing outer race into diffuser combustor group after being installed on HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

(2) For diffuser and combustors that were fully disassembled, assemble the diffuser and combustor by means of 72-41-00, Assembly-01 Task 72-41-00-400-001. For diffuser and combustors with only the No. 3 bearing outer race removed, assemble the diffuser and combustor by 72-41-00, Installation-01 Task 72-41-00-430-001.

B. Equipment And Materials Required

Standard Tools:
0.250-28 Jackscrews (Four Required)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29606	Control, Heater (Optional To PWA 29754)
PWA 29754	Control, Heater
PWA 76154	Adapter (Two Required)
PWA 85056	Cover (Optional To PWA 85802)
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Required)

Special Tools:

(CONTINUED)

PWA 85679	Heater (Optional to PWA 85795)
PWA 85701	Guide
PWA 85751	Bracket (Two Required)
PWA 85795	Heater
PWA 85802	Cover
PWA 85926	Cooler
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 105513	Heater, Electric (For HPC With The Ring Style Case, Post SB PW4ENG 72−756 Or Or PW4ENG 72−759 As Applicable)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−059	Wax, Paraffin (PMC 9552)
P05−102	Ice, Dry
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
R P05−292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−41/1/1

C. Procedure
See Figure 402.

(1) Remove PWA 85159 Thread Protector (403/7) and PWA 85428 Knife−Edge Protector (403/6) from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(2) Visually inspect HPC rear drum OD thrust balance knife−edge per 72−00−35, Inspection/Check−02 (visual

only) Task 72-00-35-210-004. Reject the airseal with cracks confirmed by visual inspection.

(3) Measure thickness of No. 3 bearing front seal seat across (402/3) thinner, ID, section of seal seat. Measure No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/1) thickness. Record this total thickness as Dimension A.

(4) Measure distance from end of HPC rear hub (402/4) down to seal seat shoulder (402/5) on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(5) For engines with a gasket groove on the rear flange of the HPC rear case (Post SB PW4ENG 72-48 and Pre SB PW4ENG 72-756), install gasket to flange groove and secure in place with Paraffin Wax P05-059. See Figure 403.

NOTE: Engines prior to (SB PW4ENG 72-48 and Post SB PW4ENG 72-756) do not accept gasket at Flange K.

(6) For engines with the ring style case (Post SB PW4ENG 72-756), use a PWA 105513 Heater to heat the HPC rear case rear flange as follows:

(a) Move the clamp block outboard until it is clear of the HPC rear case rear flange.

(b) Make sure that the thermocouple is in its stored position Adapter as stamped on the tool to prevent damage.

(c) Carefully move the Heater over the HPC rear shaft and engage the six Locator details on the Rear Case rear flange.

(d) Move the clamp block inboard and tighten the plastic knob.

(e) Move the thermocouple from its stored position adapter to its side of the heater adapter and let it contact the HPC rear case rear flange.

(f) Connect the Heater to the PWA 29606 or PWA 29754 Heater Control.

(g) Heat the HPC rear case rear flange to 300°F (149°C).

(h) When the rear flange is at the correct temperature turn off the Controller.

(i) Put the thermocouple is in its stored position Adapter as stamped on the tool.

(j) Loosen the plastic knob and move the clamp block outboard.

(k) Carefully remove the Heater from the HPC rear case.

(7) Install two PWA 85751 Handling Brackets to diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

(8) For PWA 85701 Guide, retract two setscrews on side of guide. Position PWA 85701 Guide or PWA 85308 Guide larger diameter end first on HPC rear hub and seat on seal seat shoulder. For PWA 85701 Guide, handtighten two setscrews on side of guide.

(9) Install three PWA 85310 Alignment Pins into rear flange of HPC case.

(a) Remove screws from storage locations in plate details of alignment pins.

(b) Locate three equally spaced 0.250−28 Jackscrew holes in rear flange of HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through unthreaded holes in rear flange of HPC case. Secure pins with detail screws.

(10) Using hoist, connect PWA 28657 Sling with two PWA 76154 Adapters to outer trunnion spools of PWA 85751 Brackets on diffuser case.

(11) Using hoist position diffuser and combustor assembly over HPC rear hub. Align pins in HPC rear case with mating holes in diffuser case. With workbolts and nuts, seat diffuser case on HPC rear case.

(12) Remove work bolts, nuts, and PWA 85310 Pins. For PWA 85701 Guide, retract two setscrews on side of guide. Remove PWA 85701 Guide or PWA 85308 Guide from HPC rear hub.

(13) Remove PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(14) Install the Flange K hardware as follows: Refer to 72−00−41, Installation−20 (Task 72−00−41−420−020).

(15) Install PWA 85802 Protector Cover or PWA 85056 Protector Cover (404/5) over No. 3 bearing outer race retaining nut installed in housing. If PWA 85056 Protector Cover is used, slowly rotate cover until the three spring plungers seat in holes in retaining nut.

(16) Assemble PWA 85067 Fixture (404/3) to No. 3 bearing front seal seat (404/4). See Figure 404.

(17) Install fixture with seal seat polished face down over HPC rear hub and drift to seat if necessary. Remove fixture.

(18) Assemble PWA 85068 Fixture (404/1) to No. 3 bearing seal spacer (404/2).

(19) Install fixture with seal spacer over HPC rear hub and drift to seat if necessary. Remove fixture.

(20) Remove PWA 85168 Protector (405/5) from diffuser case. See See Figure 405.

(21) Remove PWA 85802 Protector Cover or PWA 85056 Protector Cover from housing.

(22) Chill HPC hub with PWA 85926 Cooler(405/4) with Dry Ice P05−102.

(23) Install cooler in HPC hub and attach shop air to cooler.

(24) Heat No. 3 bearing outer race with PWA 85795 Heater or PWA 85679 Heater (405/6) and PWA 29754 Control or equivalent (405/3).

(25) After parts are properly heated and chilled, remove heater and cooler.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(26) Install No. 3 bearing inner race and rollers (405/2) onto HPC rear hub, puller groove up. Seat bearing using PWA 85070 Drift (405/1). Remove drift.

(27) Install PWA 85168 Protector (405/7) to diffuser case.

(28) Using depth gage measure distance from end of HPC rear hub down to rear of inner race and roller. Record this distance as Dimension C. See Figure 402.

(29) Dimension C must not be less than previously taken Dimension B minus Dimension A.

NOTE: Dimension C less than required indicates bearing is not fully seated.

(30) Install PWA 85159 Thread Protector (405/5) over HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To Complete Installation Of Diffuser Combustor. Refer to 72−00−41, Installation−02 (Task 72−00−41−420−002).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From Front End Down To Horizontal Position. Refer to 72-00-00, Special Procedures-10 (Task 72-00-00-420-002-A00).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(8) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(10) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(11) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(12) Install The LPC/LPT Coupling. Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

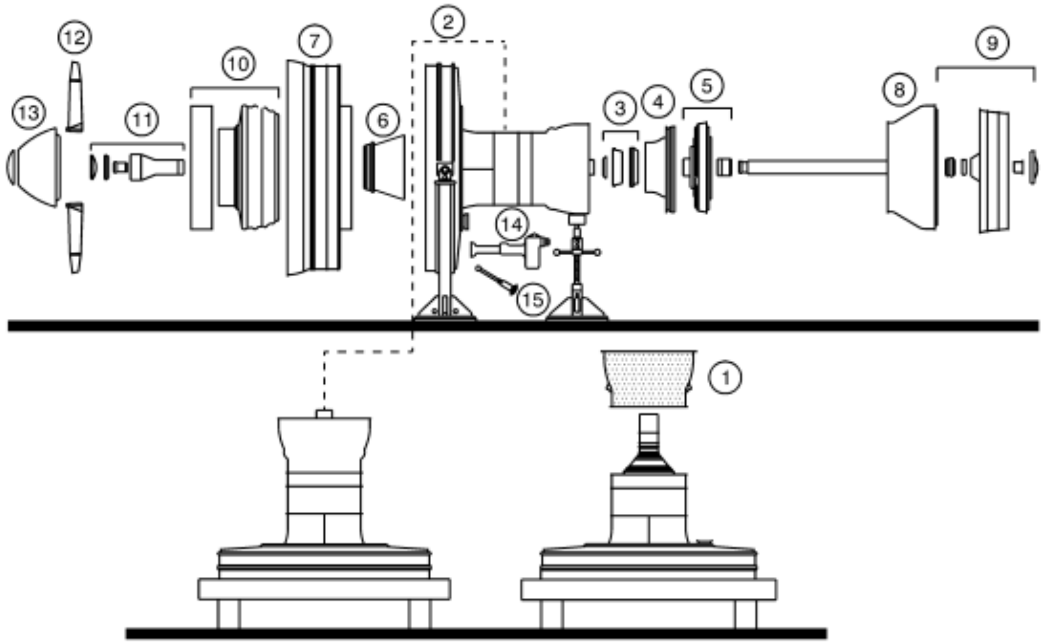
(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(14) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(15) Install The Main Gearbox. Refer to 72-00-61, Installation-01 (Task 72-00-61-420-001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Installation-03 (Task 72-00-34-450-001).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−01



1. INSTALL DIFFUSER AND COMBUSTOR.
2. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO HORIZONTAL.
3. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
4. INSTALL TURBINE NOZZLE.
5. INSTALL HIGH PRESSURE TURBINE (HPT).
6. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
7. INSTALL FAN CASE.
8. INSTALL LOW PRESSURE TURBINE (LPT).
9. INSTALL TURBINE EXHAUST CASE.
10. INSTALL LOW PRESSURE COMPRESSOR (LPC).
11. INSTALL LPC/LPT COUPLING.
12. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
13. INSTALL COMPRESSOR INLET CONE.
14. INSTALL MAIN GEARBOX.
15. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-01

Task 72-00-41-420-006:

1. Install Diffuser And Combustor (Vertical) With No. 3 Bearing Outer Race Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-15 Task 72-00-41-420-013 for the applicable procedure necessary for the installation of the No. 3 bearing outer race into the diffuser combustor group after installation on the HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures show where necessary in the text that follows and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

(2) For diffuser and combustors that were fully disassembled, assemble the diffuser and combustor by 72-41-00, Assembly-01 Task 72-41-00-400-001. For diffuser and combustors with only the No. 3 bearing outer race removed, assemble the diffuser and combustor by 72-41-00, Installation-01 Task 72-41-00-430-001.

B. Equipment And Materials Necessary

Standard Tools:
0.250-28 Jackscrews (Four Necessary)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29606	Control, Heater (Optional To PWA 29754)
PWA 29754	Control, Heater
PWA 76154	Adapter (Two Necessary)
PWA 85056	Cover (Optional To PWA 85802)
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Necessary)
PWA 85679	Heater (Optional To PWA 85795

Special Tools:

(CONTINUED)

PWA 85701	Guide
PWA 85751	Bracket (Two Necessary)
PWA 85795	Heater
PWA 85802	Cover
PWA 85926	Cooler
PWA 85983	Adapter, Stabilizer (Two Necessary Twin Overhead Rail System Only)
PWA 105513	Heater, Electric (For HPC With The Ring Style Case, Post SB PW4ENG 72-756 Or PW4ENG 72-759 As Applicable)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-102	Ice, Dry
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
R P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-00-41/1/1

C. Procedure
See Figure 402.

(1) Remove the PWA 85159 Thread Protector (403/7) and the PWA 85428 Knife-Edge Protector (403/6) from the HPC rear hub.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(2) Make a visual inspection of the HPC rear drum OD thrust balance knife-edge by 72-00-35, Inspection/Check-02

(visual only) Task 72−00−35−210−004. Reject the airseal with cracks found by the visual inspection.

(3) Measure the thickness of the No. 3 bearing front seal seat across (402/3) the thinner, ID, section of the seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness and the No. 3 bearing inner race and rollers (402/1) thickness. Make a record of this total thickness as Dimension A.

(4) Measure the distance from the end of the HPC rear hub (402/4) down to the seal seat shoulder (402/5) on the hub. Make a record of this dimension as Dimension B.

NOTE: Dimensions A and B are used to do a seating check later during this installation procedure.

(5) For engines with a gasket groove on the rear flange of the HPC rear case (Pre SB PW4ENG 72−756, or PW4ENG 72−759 as applicable), install a gasket to the flange groove and hold in place with Paraffin Wax P05−059. See Figure 403.

(6) For engines with the ring style case (Post SB PW4ENG 72−756 or PW4ENG 72−759 as applicable), use a PWA 105513 Heater to heat the HPC rear case rear flange as follows:

(a) Move the clamp block outboard until it is clear of the HPC rear case rear flange.

(b) Make sure that the thermocouple is in its stored position Adapter as stamped on the tool to prevent damage.

(c) Carefully move the Heater over the HPC rear shaft and engage the six Locator details on the rear case rear flange.

(d) Move the clamp block inboard and tighten the plastic knob.

(e) Move the thermocouple from its stored position adapter to its side of the heater adapter and let it contact the HPC rear case rear flange.

(f) Connect the Heater to the PWA 29606 or PWA 29754 Heater Control.

(g) Heat the HPC rear case rear flange to 300°F (149°C).

(h) When the rear flange is at the correct temperature turn off the Controller.

(i) Put the thermocouple is in its stored position Adapter as stamped on the tool.

(j) Loosen the plastic knob and move the clamp block outboard.

(k) Carefully remove the Heater from the HPC rear case.

(7) Install two PWA 85751 Handling Brackets to the diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations. Install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket to the rear most two holes as marked on the bracket.

(8) For PWA 85701 Guide, retract two setscrews on the side O of the guide. Install the PWA 85701 Guide or PWA 85308 Guide, larger diameter end first, to the HPC rear hub and engage on the seal seat shoulder. For PWA 85701 Guide, handtighten two setscrews on the side of guide.

(9) Install three PWA 85310 Alignment Pins into the rear flange of the HPC case.

(a) Remove the screws from the storage locations in the plate details of the alignment pins.

(b) Locate three equally spaced 0.250−28 Jackscrew holes in the rear flange of the HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through the unthreaded holes in the rear flange of the HPC case. Attach the pins with the detail screws.

(10) Use a hoist and connect the PWA 28657 Sling with two PWA 76154 Adapters to the outer trunnion spools of the PWA 85751 Brackets on the diffuser case.

(11) Use a hoist and install the diffuser and combustor assembly over the HPC rear hub. Align the pins in the HPC rear case with the holes in the diffuser case. With workbolts and nuts, seat the diffuser case on the HPC rear case.

(12) Remove the work bolts, nuts, and PWA 85310 Pins. For the PWA 85701 Guide, retract the two setscrews on the side of the guide. Remove the PWA 85701 Guide or PWA 85308 Guide from the HPC rear hub.

(13) Remove PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(14) Install the Flange K hardware as follows: Refer to 72−41−00, Installation−20 (Task 72−00−41−420−020).

(15) Install the PWA 85802 Protector Cover or PWA 85056 Protector Cover (404/5) over the No. 3 bearing outer race retaining nut installed in the housing. If PWA 85056 Protector Cover is used, slowly turn the cover until the three spring plungers engage in the holes in retaining nut.

(16) Assemble the PWA 85067 Fixture (404/3) to the No. 3 bearing front seal seat (404/4). See Figure 404.

(17) Install the fixture with seal seat polished face down over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(18) Assemble the PWA 85068 Fixture (404/1) to the No. 3 bearing seal spacer (404/2).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−01

(19) Install the fixture with the seal spacer over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(20) Remove the PWA 85168 Protector (405/5) from the diffuser case. See Figure 405.

(21) Remove the PWA 85802 Protector Cover or PWA 85056 Protector Cover from the housing.

(22) Chill the HPC hub with the PWA 85926 Cooler (405/4) with Dry Ice P05−102.

(23) Install the cooler in the HPC hub and attach shop air to the cooler.

(24) Heat the No. 3 bearing outer race with the PWA 85795 Heater or PWA 85679 Heater (405/6) and PWA 29754 Control or equivalent (405/3).

(25) After the parts are correctly heated and chilled, remove the heater and cooler.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(26) Install the No. 3 bearing inner race and rollers (405/2) onto the HPC rear hub, puller groove up. Seat the bearing with the PWA 85070 Drift (405/1). Remove the drift.

(27) Install PWA 85168 Protector (405/7) to the diffuser case.

(28) Use a depth gage and measure the distance from the end of the HPC rear hub down to the rear of the inner race and roller. Make a record of this distance as Dimension C. See Figure 402.

(29) Dimension C must not be less than Dimension B minus Dimension A.

NOTE: An indication that the bearing is not fully seated is when Dimension C is less than necessary.

(30) Install PWA 85159 Thread Protector (405/5) over the HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To Complete Installation Of Diffuser Combustor. Refer to 72-00-41, Installation-02 (Task 72-00-41-420-002).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From Front End Down To Horizontal Position. Refer to 72-00-00, Special Procedures-10 (Task 72-00-00-420-002-A00).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(8) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(10) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(11) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

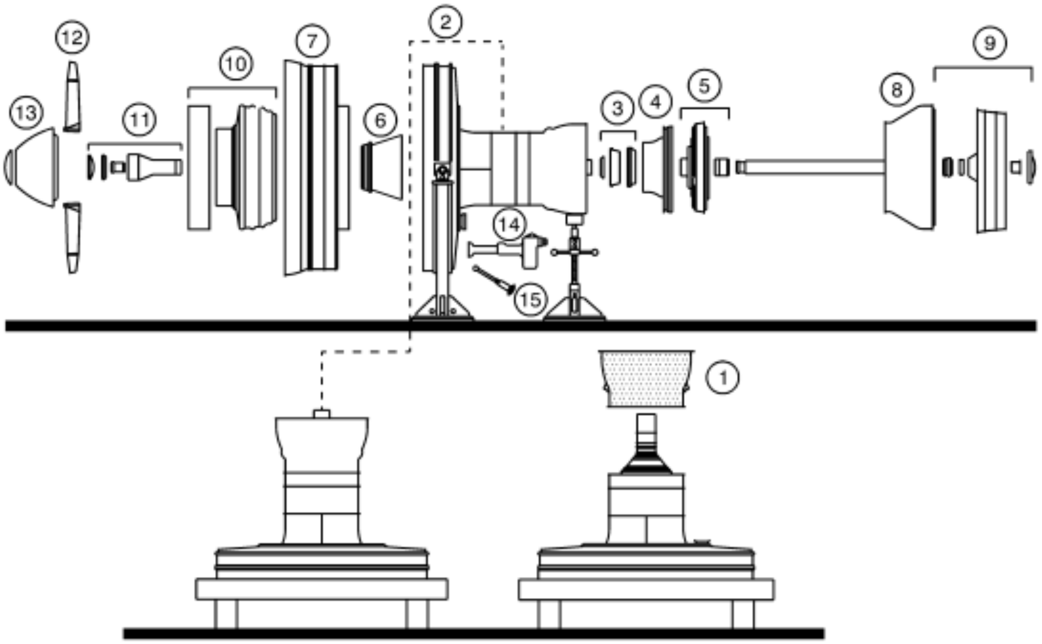
(12) Install The LPC/LPT Coupling. Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(14) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(15) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).



1. INSTALL DIFFUSER AND COMBUSTOR.
2. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO HORIZONTAL.
3. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
4. INSTALL TURBINE NOZZLE.
5. INSTALL HIGH PRESSURE TURBINE (HPT).
6. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
7. INSTALL FAN CASE.
8. INSTALL LOW PRESSURE TURBINE (LPT).
9. INSTALL TURBINE EXHAUST CASE.
10. INSTALL LOW PRESSURE COMPRESSOR (LPC).
11. INSTALL LPC/LPT COUPLING.
12. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
13. INSTALL COMPRESSOR INLET CONE.
14. INSTALL MAIN GEARBOX.
15. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-41-420-002:

1. Install External Parts After Diffuser And Combustor Installation

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-021	Compound, Antigalling (PWA 550)
R P06-053	Lubricant, Sealing Ring (PWA 36500)
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-26-00/1/20
Gasket	1	75-26-00/1/30

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407 and Figure 408.

(1) Install EEC PT4.95 tube assembly (AS01) as follows.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(a) Remove protective closures.

(b) For engines without the maintenance break at Flange K (Pre SB PW4ENG 73-106) connect the tube to the PT4.95 tube (AS04) at 11:30 o'clock position adjacent to Flange E. Tighten by hand.

(c) For engines with the maintenance break at Flange K (Post SB PW4ENG 73-106) connect the tube to the PT4.95 tube (AS41) at 11:00 o'clock position adjacent to Flange K. Tighten by hand.

(d) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to brackets.

(e) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque forward tube nut to tube coupling to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(2) (Pre SB PW4ENG 72-491) Install No. 4 bearing oil pressure tube assembly (LP15) as follows.

(a) Remove protective closures and lubricate tube threads at each end with Antigalling Compound P06-021. See Figure 401 (Sheet 7). Install the tube to the engine and attach the forward end of the tube to the manifold tee forward of Flange J at approximately the 8 o'clock position handtight only.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to fuel injector bracket at approximately 9 o'clock position on diffuser case handtight only.

(d) Install two clamps, bolt, spacer, and nut securing tube to adjacent EEC PT4.95 (AS01) tube handtight only. If the engine does not have brazed wear sleeves on the PT4.95 tube (AS01), install the grommet halves (clip on wear sleeves) to the tube before you install the clamp.

(e) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque forward tube nut to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(g) (Reference 2151) Position spray shield to inboard side of connection and secure with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(3) (Post SB PW4ENG 72−491) Install No. 4 bearing oil pressure tube assembly (LP15) as follows.

(a) Remove protective closures and lubricate tube threads at each end with Antigalling Compound P06−021. See Figure 401 (Sheet 7). Install the tube to the engine and attach the forward end of the tube to the manifold tee forward of Flange J at approximately the 8 o'clock position, handtight only.

(b) Install the deoiler idler bearing pressure line (LP35) nut to the tee fitting, handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position, handtight only.

(d) Install clamp and bolt, threads lubricated with Engine Oil P03−001, to hold the tube to Flange K bracket assembly at approximately 9 o'clock position, handtight only.

(e) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to fuel injector bracket at approximately 9 o'clock position on diffuser case, handtight only.

(f) Install two clamps, bolt, spacer, and nut securing tube to adjacent EEC PT4.95 (AS01) tube, handtight only. If the engine does not have brazed wear sleeves on the PT4.95 tube (AS01), install the grommet halves (clip on wear sleeves) to the tube before you install the clamp.

(g) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Torque forward tube nut to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(i) Torque the nut from the deoiler idler bearing pressure line (LP35) to the tee fitting to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(j) (Reference 2151) Position spray shields to the inboard side of the forward tube nut connection and the tee fitting connection and secure with hose clamps. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(4) (Pre SB PW4ENG 79−52) Install the (rear) No. 3 bearing oil pressure tube assembly (LP19) as follows.

(a) Remove the protection covers. Lubricate the tube coupling threads at the strainer housing with Antiseize Paste P06−054. Wipe off unwanted paste. Lubricate the threads at the other end with Engine Oil P03−001.

(b) Install the tube to the diffuser case internal tube nut at approximately 9:30 o'clock position. Tighten by hand only. If installed, connect the (front) No. 3 bearing oil pressure manifold (LP18) to the strainer housing and tighten by hand only.

(c) Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts that attach the tube to the Flange K brackets. Tighten by hand.

NOTE: For engines with the revised clamping (Post SB PW4ENG 72−211) do not attach this tube to the Flange K bracket above the strainer housing. Attach only the fuel tube. Torque the fuel tube clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: DO NOT TORQUE THE TUBE NUTS OR THE CLAMP BOLTS AT THIS TIME. YOU MUST COMPLETE THE INSTALLATION OF THIS TUBE AFTER YOU INSTALL OTHER TUBES AFTER THE GEARBOX INSTALLATION. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(d) Do not torque the tube nuts or clamp bolts at this time. Install a tag on the manifold "not torqued".

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE STRAINER HOUSING WHEN YOU LOOSEN OR TIGHTEN THE STRAINER. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(e) Install the packing, lubricated with Engine Oil P03−001, to the strainer. Lubricate the threads of the strainer with Engine Oil P03−001. Install the strainer to the strainer housing. While you hold the housing with a wrench, torque the strainer to 275 − 300 lb−in. (31.071 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the strainer.

NOTE: You will complete the installation of the above tube (LP19) in 72−00−61, Installation−02 Task 72−00−61−420−002. See the installation of the oil trim pressure tube (LP32).

(5) (Post SB PW4ENG 79−52) (Pre/Post SB PW4ENG 72−491) Install the No. 3 bearing oil pressure tube assembly (LP19) as follows.

(a) Remove the protection covers. Lubricate the threads of the tube nut at the elbow end with Engine Oil P03−001.

(b) Install the tube to the diffuser case internal tube at approximately the 10 o'clock position.

(c) Install the strainer to the (front) of the tube.

(d) Remove the protection covers from the adapter. Install a packing lubricated with Engine Oil P03−001 to the adapter.

(e) Install the adapter to the (front) of the tube and attach with bolts, threads lubricated with Engine Oil P03−001 and nuts.

(f) Install the clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts that attach the tube to the bracket on Flange K.

CAUTION: DO NOT TORQUE THE TUBE NUTS OR THE CLAMP BOLTS AT THIS TIME. YOU MUST COMPLETE THE INSTALLATION OF THIS TUBE AFTER YOU INSTALL OTHER TUBES AFTER THE GEARBOX INSTALLATION. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(g) Do not torque the tube nuts or clamp bolts at this time. Install a tag on the manifold "not torqued".

NOTE: You will complete the installation of the above tube (LP19) in 72−00−61, Installation−02 Task 72−00−61−420−002. See the installation of the oil trim pressure tube (LP32).

(6) (Pre SB PW4ENG 72−567) Install the (left) diffuser seal air vent tube assembly (AP22) as follows. See Figure 402 (Sheet 1), Figure 402 (Sheet 2), Figure 402 (Sheet 3), Figure 402 (Sheet 8) and Figure 402 (Sheet 9).

(a) Remove protective closures. Install gasket to groove in HPC rear case boss at approximately 10:30 o'clock position. Install deflector aligning pin with hole in HPC rear case boss.

(b) Lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install gasket to flanged end of tube and secure in place with Paraffin Wax P05-059.

(c) Install tube to engine and connect tube nut to diffuser case intenal tube at approximately 11 o'clock position handtight only.

(d) Install bracket and bolts, threads lubricated with Engine Oil P03-001, to secure flanged end of tube to HPC rear case handtight only.

(e) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to secure tube to fuel injector bracket. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque tube nut to 825 - 900 lb-in. (93.212 - 101.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(g) Torque bolts securing tube flange to HPC rear case to 85 - 95 lb-in. (9.604 - 10.734 N.m) then retorque without loosening until required torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(h) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to secure PT4.95 tube and air shutoff valve signal tube to bracket at flanged end of tube. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(7) (Post SB PW4ENG 72-567) Install the (left) diffuser seal air vent tube assembly (AP22) as follows. See Figure 402 (Sheet 4), Figure 402 (Sheet 5), Figure 402 (Sheet 6), Figure 402 (Sheet 7), Figure 402 (Sheet 8) and Figure 402 (sheet 9).

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove the protection covers. Install a gasket to the groove in the HPC rear case boss at approximately the 10:30 o'clock position.

(b) Install a gasket to the flanged end (with four holes) of the tube and attach the gasket in place with Paraffin Wax P05-059. Install the plate (pre SB PW4ENG 75-110) to the recessed area of the HPC case boss or align the pin on the deflector (Post SB PW4ENG 75-110) with the hole in the HPC case boss and install the deflector to the recessed area.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 402.

(c) Install the locks to the diffuser case internal tube inside boss at approximately the 11 o'clock position. Attach the locks in place with Paraffin Wax P05-059.

(d) (Reference 2261) Hold the tube locks inward against the tube lip. Measure and make sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and make sure the internal tube lip is engaged properly.

(e) Install the four hole gasket with the raised portion outward toward the tube flange. Install the second gasket in groove of the same opening and attach both gaskets in place with Paraffin Wax P05-059.

(f) Install the tube to the engine (gaskets in place). Attach the tube to the diffuser case with a bracket and bolts, threads lubricated with Engine Oil P03-001. Tighten the bolts by hand.

(g) Attach the tube to the HPC rear case with a bracket and bolts, threads lubricated with Engine Oil P03-001. Tighten the bolts by hand.

(h) Install a clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to attach the tube to the fuel injector bracket. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque the bolts that attach the tube flange to the HPC rear case to 85 - 95 lb-in. (9.604 - 10.734 N.m). Without loosening the bolts, torque again until the 85 - 95 lb-in. (9.604 - 10.734 N.m) is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(j) Torque the bolts that attach the tube flange to the diffuser case and the four bolts that attach a bracket to the tube flange to 85 - 95 lb-in. (9.604 - 10.734 N.m). Without loosening the bolts, torque again until the 85 - 95 lb-in. (9.604 - 10.734 N.m) is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(k) Install a clamp to the No. 3 bearing breather tube assembly (LB03). Attach the clamp to the bracket from the diffuser pad at the 11 o'clock position with a bolt, threads lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) Install (upper) turbine blade cooling tube assembly (AP38) as follows.

(a) Remove protective closures. Install gasket to groove in turbine cooling air shutoff valve at approximately 10 o'clock position and secure in place with Paraffin Wax P05-059.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 402.

(b) Install locks to diffuser case internal tube inside boss at approximately 2 o'clock position. Secure in place with Paraffin Wax P05-059.

(c) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly.

(d) (Pre SB PW4ENG 72-572 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Install the gasket and metering plate in the four hole flanged end of the tube and hold in place with Paraffin Wax P05-059.

(e) (Post SB PW4ENG 72-572 and Pre SB PW4ENG 72-627 or Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Install the gasket and ring spacer in the four hole flanged end of the tube and hold in place with Paraffin Wax P05-059.

(f) Install four hole gasket, with raised portion visible, into tube flange. Install second gasket in groove of same opening and secure both in place with Paraffin Wax P05-059.

(g) Install tube to engine (gaskets in place) and secure to diffuser case with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(h) Secure tube to cooling air shutoff valve with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(i) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to secure tube to Flange K bracket at approximately 11 o'clock position. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(j) Torque bolts attaching each end of tube to 85 - 95 lb-in. (9.604 - 10.734 N.m) then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(9) Install the (front) No. 3 bearing oil vent tube assembly (LD01) as follows. See Figure 403.

(a) Remove protective closures and lubricate tube nut threads at elbow end with Engine Oil P03-001. Install tube to engine and attach elbow end of tube to diffuser case internal tube at approximately 8 o'clock position handtight only.

(b) Temporarily install clamp, bolt threads lubricated with Engine Oil P03-001, and nut securing tube to diffuser case bracket at approximately 9 o'clock position handtight only.

(c) Torque tube nut to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(10) Install (upper) No. 3 bearing breather tube assembly (LB03) as follows.

(a) Remove protective closures and lubricate elbow threads with Engine Oil P03-001. Install tube to engine and connect elbow to diffuser case internal tube nut at approximately 1 o'clock position handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flange K brackets at approximately 10, 12 and 1 o'clock positions handtight only.

(c) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque diffuser case internal tube nut to tube elbow to 650 - 700 lb-in. (73.440 - 79.089 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(11) Install bleed and HPC air valve supply tube assembly (AA34) as follows.

(a) Remove protective closures and lubricate tube nut threads at each end with Antiseize Paste P06-054. Wipe off unwanted paste.

(b) Install tube to engine and secure with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to Flange J bracket handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to secure tube to Flange K bracket at approximately 12 o'clock position. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(12) (Pre SB PW4ENG 72-567) Install EEC PB tube assembly (AS09) as follows. See Figure 404 (Sheet 1), Figure 404 (Sheet 4) and Figure 404 (Sheet 5).

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(a) Remove protective closures. Install tube to engine and connect elbow end to diffuser case adapter at approximately 1 o'clock position and coupling end to tube at approximately 12:30 o'clock position at Flange E.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position handtight only.

(c) Install clamp, spacer, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange H bracket at approximately 12:30 o'clock position handtight only.

(d) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to HPC bracket at approximately 12:30 o'clock position rearward of Flange E handtight only.

(e) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque both ends of tube to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(13) (Post SB PW4ENG 72-567) Install EEC PB tube assembly (AS09) as follows. See Figure 404 (Sheet 2), Figure 404 (Sheet 3), Figure 404 (Sheet 4) and Figure 404 (Sheet 5).

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(a) Remove protective closures. Install tube to engine and connect elbow end to diffuser case adapter at approximately 3 o'clock position and coupling end to tube at approximately 12:30 o'clock position at Flange E.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to HPC bracket at approximately 12:30 o'clock position rearward of Flange E handtight only. See View B.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001 securing tube to Flange H bracket at approximately 12:30 o'clock position handtight only. See View C.

(d) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position handtight only. See View D.

(e) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket on Flange K at approximately 1:30 o'clock position handtight only. See View A.

(f) Attach the tube to a bracket that is attached to a cover on the diffuser case pad at approximately the 1:30 o'clock position with a "clamp and loop type support" and bolt, threads lubricated with Engine Oil P03-001 and nut. Tighten the bolt handtight only. See View E.

(g) Install "clamp and loop type support", bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket on Flange K at approximately 2:30 o'clock position handtight only. See View F.

(h) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque both ends of the tube to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(14) Install HPC and bleed valve supply tube assembly (AA23) as follows.

(a) Remove protective closures and lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install tube to engine and connect to HPC bleed air filter and to diffuser case adapter at approximately 2 o'clock position handtight only.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to secure tube to Flange K bracket at approximately the 1 o'clock position. Bolt head towards tube (AA23) clamp and nut against tube (AS09) clamp. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(15) Install No. 3 bearing cooler air tube assemblies (AP33) and (AP34) as follows. See Figure 405.

(a) Remove protective closures and lubricate tube nut threads on both tubes with Antigalling Compound P06-021. See Figure 405. Install tubes to engine and secure tube to No. 3 bearing air cooler at approximately 2 o'clock position in fan case handtight only. Secure rear tube nuts to HPC elbow at approximately 5 o'clock position and to diffuser case elbow at approximately 6 o'clock position handtight only.

(b) Install clamps, brackets, bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tubes to the bracket attached to Flange J at approximately the 4:30 o'clock position handtight only.

(c) Install clamps, bolt, threads lubricated with Engine Oil P03-001, and nut securing tubes to Flange H bracket at approximately the 3 o'clock position handtight only.

(d) Install clamps, heat shield, bolts, threads lubricated with Engine Oil P03-001, and nuts to tubes at approximately 2:30 o'clock position forward of Flange H handtight only.

(e) Install clamps and bolts, threads lubricated with Engine Oil P03-001, securing tubes to HPC bracket at approximately 2:30 o'clock position. Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque all tube nuts at No. 3 bearing air cooler and rear elbows to 825 - 900 lb-in. (93.212 - 101.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nuts.

(16) Install diffuser seal air vent tube assemblies right (AP21) and lower (AP17) as follows. See Figure 406.

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove protective closures. Install gasket to groove in HPC rear case boss at approximately 5:30 o'clock position. Install the deflector as you align the pin with the hole in the HPC rear case boss. Hold in place with Paraffin Wax P05-059.

(b) Install gasket to groove in flange of tube (AP17) (lower) and attach to HPC rear case boss with four bolts, threads lubricated with Engine Oil P03-001, handtight only.

(c) (Post SB PW4ENG 72-514 and Pre SB PW4ENG 72-572) Install the metering plug, smaller OD inward, into the remaining end of the last installed tube (AP17). As necessary, attach the plug in position with Paraffin Wax P05-059.

(d) Install gasket to groove in four bolt hole flange of tube (AP21) (right) and attach in place with Paraffin Wax P05-059.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 406.

(e) Install locks to diffuser case internal tube inside boss at approximately 3 o'clock position. Secure in place with Paraffin Wax P05-059.

(f) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly.

(g) Install four hole gasket, with raised portion visible, into the scalloped flange end of the tube (AP21) and align the four bolt holes. Install second gasket to groove of same tube flange and attach both in place with Paraffin Wax P05-059.

(h) Install tube (AP21) (right) to engine and attach to the diffuser case with bolts, threads lubricated with Engine Oil P03-001, and bracket handtight only.

(i) Install bolts, threads lubricated with Engine Oil P03-001 and a bracket (Post SB PW4ENG 75-95) to the flange of the tube (AP21), securing lower end of tube to tube (AP17) attached to HPC rear case handtight only.

(j) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange H bracket at approximately 4 o'clock position handtight only.

(k) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to Flange K bracket. Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(l) Torque four bolts securing lower tube to HPC case and four bolts securing right tube to lower tube to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required torque, without loosening, until required torque is maintained.

(m) Torque bolts attaching upper end of tube to diffuser case to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required torque, without loosening, until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(n) Install clamps, bolt, threads lubricated with Engine Oil P03−001, and nut securing fuel tubes to previously installed bracket. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(17) Install gearbox heat shields to Flanges J and K brackets and secure with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 407.

R (18) Install a packing, lubricated with Engine Oil P03−001
R or Sealing Ring Lubricant P06−053 to the groove in
R transfer tube. Install the assembled flowmeter, transfer tube, and support to fuel distribution valve and secure with bracket (Pre SB PW4ENG 73−163 only) and bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). See Figure 408.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(19) Install flex hoses (CP11), (CP13), and the drain flex hose, threads lubricated with Engine Oil P03−001, to turbine case cooling air actuator at approximately 2

o'clock position forward of Flange H and to manifold couplings.

(a) Torque forward hose (smaller nuts) to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

(b) Torque rearward hose (larger nuts) to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts.

1. Install External Parts After Diffuser And Combustor Installation

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−059	Wax, Paraffin (PMC 9552)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
R	P06−021	Compound, Antigalling (PWA 550)
R	P06−053	Lubricant, Sealing Ring (PWA 36500)
	P06−054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75−26−00/1/20

Packing	1	79−21−00/10/60
Packing	1	79−21−00/10/60A

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407 and Figure 408.

(1) Install EEC PT4.95 tube assembly (AS01) as follows.

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(a) Remove protective closures.

(b) Connect the tube to the PT4.95 tube (AS41) at the 11:00 o'clock position adjacent to Flange K. Tighten by hand.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to brackets.

(d) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque forward tube nut to tube coupling to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(2) (Pre SB PW4ENG 72-491) Install No. 4 bearing oil pressure tube assembly (LP15) as follows.

(a) Remove protective closures and lubricate tube threads at each end with Antigalling Compound P06-021. See Figure 401 (Sheet 7). Install the tube to the engine and attach the forward end of the tube to the manifold tee forward of Flange J at approximately the 8 o'clock position handtight only.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to fuel injector bracket at approximately 9 o'clock position on diffuser case handtight only.

(d) Install two clamps, bolt, spacer, and nut securing tube to adjacent EEC PT4.95 (AS01) tube handtight only. If the engine does not have brazed wear sleeves on the PT4.95 tube (AS01), install the grommet halves (clip on wear sleeves) to the tube before you install the clamp.

(e) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque forward tube nut to 340 - 375 lb-in. (38.415 - 42.369 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) (Reference 2151) Position spray shield to inboard side of connection and secure with hose clamp. Torque hose clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(3) (Post SB PW4ENG 72-491) Install No. 4 bearing oil pressure tube assembly (LP15) as follows.

(a) Remove protective closures and lubricate tube threads at each end with Antigalling Compound P06-021. See Figure 401 (Sheet 7). Install the tube to the engine and attach the forward end of the tube to the manifold tee forward of Flange J at approximately the 8 o'clock position, handtight only.

(b) Install the deoiler idler bearing pressure line (LP35) nut to the tee fitting, handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to cooling air tube flange at approximately 9 o'clock position, handtight only.

(d) Install clamp and bolt, threads lubricated with Engine Oil P03-001, to hold the tube to Flange K bracket assembly at approximately 9 o'clock position, handtight only.

(e) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to fuel injector bracket at approximately 9 o'clock position on diffuser case, handtight only.

(f) Install two clamps, bolt, spacer, and nut securing tube to adjacent EEC PT4.95 (AS01) tube, handtight only. If the engine does not have brazed wear sleeves on the PT4.95 tube (AS01), install the grommet halves (clip on wear sleeves) to the tube before you install the clamp.

(g) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Torque forward tube nut to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(i) Torque the nut from the deoiler idler bearing pressure line (LP35) to the tee fitting to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(j) (Reference 2151) Position spray shields to the inboard side of the forward tube nut connection and the tee fitting connection and secure with hose clamps. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(4) (Pre/Post SB PW4ENG 72−491) Install the No. 3 bearing oil pressure tube assembly (LP19) as follows.

(a) Remove the protection covers. Lubricate the threads of the tube nut at the elbow end with Engine Oil P03−001.

(b) Install the tube to the diffuser case internal tube at approximately the 10 o'clock position.

(c) Install the strainer to the (front) of the tube.

(d) Remove the protection covers from the adapter. Install a packing lubricated with Engine Oil P03−001 to the adapter.

(e) Install the adapter to the (front) of the tube and attach with bolts, threads lubricated with Engine Oil P03−001 and nuts.

(f) Install the clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts that attach the tube to the bracket on Flange K.

CAUTION: DO NOT TORQUE THE TUBE NUTS OR THE CLAMP BOLTS AT THIS TIME. YOU MUST COMPLETE THE INSTALLATION OF THIS TUBE AFTER YOU INSTALL OTHER TUBES AFTER THE GEARBOX

INSTALLATION. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(g) Do not torque the tube nuts or clamp bolts at this time. Install a tag on the manifold "not torqued".

NOTE: You will complete the installation of the above tube (LP19) in 72-00-61, Installation-02 (Task 72-00-61-420-002). See the installation of the oil trim pressure tube (LP32).

(5) Install the (left) diffuser seal air vent tube assembly (AP22) as follows. See Figure 402.

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove the protection covers. Install a gasket to the groove in the HPC rear case boss at approximately the 10:30 o'clock position.

(b) Install a gasket to the flanged end (with four holes) of the tube and attach the gasket in place with Paraffin Wax P05-059. Install the plate (pre SB PW4ENG 75-110) to the recessed area of the HPC case boss or align the pin on the deflector (Post SB PW4ENG 75-110) with the hole in the HPC case boss and install the deflector to the recessed area.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 402.

(c) Install the locks to the diffuser case internal tube inside boss at approximately the 11 o'clock position. Attach the locks in place with Paraffin Wax P05-059.

(d) (Reference 2261) Hold the tube locks inward against the tube lip. Measure and make sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and make sure the internal tube lip is engaged properly.

(e) Install the four hole gasket with the raised portion outward toward the tube flange. Install the second gasket in groove of the same opening and attach both gaskets in place with Paraffin Wax P05−059.

(f) Install the tube to the engine (gaskets in place). Attach the tube to the diffuser case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(g) Attach the tube to the HPC rear case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(h) Install a clamp, bolt, threads lubricated with Engine Oil P03−001, and nut to attach the tube to the fuel injector bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Torque the bolts that attach the tube flange to the HPC rear case to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(j) Torque the bolts that attach the tube flange to the diffuser case and the four bolts that attach a bracket to the tube flange to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(k) Install a clamp to the No. 3 bearing breather tube assembly (LB03). Attach the clamp to the bracket from the diffuser pad at the 11 o'clock position with a bolt, threads lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) Install (upper) turbine blade cooling tube assembly (AP38) as follows.

(a) Remove protective closures. Install gasket to groove in turbine cooling air shutoff valve at approximately 10 o'clock position and secure in place with Paraffin Wax P05−059.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 402.

(b) Install locks to diffuser case internal tube inside boss at approximately 2 o'clock position. Secure in place with Paraffin Wax P05−059.

(c) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly.

(d) (Pre SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the gasket and metering plate in the four hole flanged end of the tube and hold in place with Paraffin Wax P05−059.

(e) (Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the gasket and ring spacer in the four hole flanged end of the tube and hold in place with Paraffin Wax P05−059.

(f) Install four hole gasket, with raised portion visible, into tube flange. Install second gasket in groove of same opening and secure both in place with Paraffin Wax P05−059.

(g) Install tube to engine (gaskets in place) and secure to diffuser case with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(h) Secure tube to cooling air shutoff valve with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(i) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut to secure tube to Flange K bracket at approximately 11 o'clock position. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(j) Torque bolts attaching each end of tube to 85 − 95 lb−in. (9.604 − 10.734 N.m) then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(7) Install the (front) No. 3 bearing oil vent tube assembly (LD01) as follows. See Figure 403.

(a) Remove protective closures and lubricate tube nut threads at elbow end with Engine Oil P03−001. Install tube to engine and attach elbow end of tube to diffuser case internal tube at approximately 8 o'clock position handtight only.

(b) Temporarily install clamp, bolt threads lubricated with Engine Oil P03−001, and nut securing tube to diffuser case bracket at approximately 9 o'clock position handtight only.

(c) Torque tube nut to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(8) Install (upper) No. 3 bearing breather tube assembly (LB03) as follows.

(a) Remove protective closures and lubricate elbow threads with Engine Oil P03−001. Install tube to engine and connect elbow to diffuser case internal tube nut at approximately 1 o'clock position handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flange K brackets at approximately 10, 12 and 1 o'clock positions handtight only.

(c) Install clamp and bolt, threads lubricated with Engine Oil P03-001, attach the tube to the bracket attached to the diffuser case internal tube flange at approximately the 11 o'clock position handtight only.

(d) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque diffuser case internal tube nut to tube elbow to 650 - 700 lb-in. (73.440 - 79.089 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(9) Install bleed and HPC air valve supply tube assembly (AA34) as follows.

(a) Remove protective closures and lubricate tube nut threads at each end with Antiseize Paste P06-054. Wipe off unwanted paste.

(b) Install tube to engine and secure with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to Flange J bracket handtight only.

(c) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to secure tube to Flange K bracket at approximately 12 o'clock position. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque tube nuts to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(10) Install EEC PB tube assembly (AS09) as follows. See Figure 404.

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(a) Remove protective closures. Install tube to engine and connect elbow end to diffuser case adapter at approximately 1 o'clock position and coupling end to tube at approximately 12:30 o'clock position at Flange E.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to HPC bleed valve flange at approximately 1:30 o'clock position handtight only.

(c) Install clamp, spacer, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to Flange H bracket at approximately 12:30 o'clock position handtight only.

(d) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to HPC bracket at approximately 12:30 o'clock position rearward of Flange E handtight only.

(e) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque both ends of tube to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(11) Install HPC and bleed valve supply tube assembly (AA23) as follows.

(a) Remove protective closures and lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install tube to engine and connect to HPC bleed air filter and to diffuser case adapter at approximately 2 o'clock position handtight only.

(b) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut to secure tube to Flange K bracket at approximately the 1 o'clock position. Bolt head towards tube (AA23) clamp and nut against tube (AS09) clamp. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(12) Install No. 3 bearing cooler air tube assemblies (AP33) and (AP34) as follows. See Figure 405.

(a) Remove protective closures and lubricate tube nut threads on both tubes with Antigalling Compound P06−021. See Figure 405. Install tubes to engine and secure tube to No. 3 bearing air cooler at approximately 2 o'clock position in fan case handtight only. Secure rear tube nuts to HPC elbow at approximately 5 o'clock position and to diffuser case elbow at approximately 6 o'clock position handtight only.

(b) Install clamps, brackets, bolts, threads lubricated with Engine Oil P03−001, and nuts to attach the tubes to the bracket attached to Flange J at approximately the 4:30 o'clock position handtight only.

(c) Install clamps, bolt, threads lubricated with Engine Oil P03−001, and nut securing tubes to Flange H bracket at approximately the 3 o'clock position handtight only.

(d) Install clamps, heat shield, bolts, threads lubricated with Engine Oil P03−001, and nuts to tubes at approximately 2:30 o'clock position forward of Flange H handtight only.

(e) Install clamps and bolts, threads lubricated with Engine Oil P03−001, securing tubes to HPC bracket at approximately 2:30 o'clock position. Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque all tube nuts at No. 3 bearing air cooler and rear elbows to 825 - 900 lb-in. (93.212 - 101.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(13) Install diffuser seal air vent tube assemblies right (AP21) and lower (AP17) as follows. See Figure 406.

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove protective closures. Install gasket to groove in HPC rear case boss at approximately 5:30 o'clock position. Install the deflector as you align the pin with the hole in the HPC rear case boss. Hold in place with Paraffin Wax P05-059.

(b) Install gasket to groove in flange of tube (AP17) (lower) and attach to HPC rear case boss with four bolts, threads lubricated with Engine Oil P03-001, handtight only.

(c) Install gasket to groove in four bolt hole flange of tube (AP21) (right) and attach in place with Paraffin Wax P05-059.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 406.

(d) Install locks to diffuser case internal tube inside boss at approximately 3 o'clock position. Secure in place with Paraffin Wax P05-059.

(e) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly.

(f) Install four hole gasket, with raised portion visible, into the scalloped flange end of the tube (AP21) and align the four bolt holes. Install second gasket to groove of same tube flange and attach both in place with Paraffin Wax P05−059.

(g) Install tube (AP21) (right) to engine and attach to the diffuser case with bolts, threads lubricated with Engine Oil P03−001, and bracket handtight only.

(h) Install bolts, threads lubricated with Engine Oil P03−001, and bracket to the flange of the tube (AP21), and attach the lower end of the tube to the tube (AP17) attached to the HPC rear case handtight only.

(i) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to Flange H bracket at approximately 4 o'clock position handtight only.

(j) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing tube to bracket attached to Flange K bracket. Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(k) Torque four bolts securing lower tube to HPC case and four bolts securing right tube to lower tube to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required torque, without loosening, until required torque is maintained.

(l) Torque bolts attaching upper end of tube to diffuser case to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required torque, without loosening, until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(m) Install clamps, bolt, threads lubricated with Engine Oil P03−001, and nut securing fuel tubes to previously installed bracket. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-02

(14) Install gearbox heat shields to Flanges J and K brackets and secure with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 407.

R R R (15) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the groove in transfer tube. Install the assembled flowmeter, transfer tube and support to fuel distribution valve and secure with bracket (Pre SB PW4ENG 73-163 only) and bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). See Figure 408.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(16) Install flex hoses (CP11), (CP13), and the drain flex hose, threads lubricated with Engine Oil P03-001, to turbine case cooling air actuator at approximately 2 o'clock position forward of Flange H and to manifold couplings.

(a) Torque forward hose (smaller nuts) to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(b) Torque rearward hose (larger nuts) to 450 - 500 lb-in. (50.843 - 56.492 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-03

Task 72-00-41-420-003:

1. Install No. 3 Bearing Rear Seal Assembly And Rear Seal Seat (Horizontal)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: For vertical installation of No. 3 bearing rear seal assembly and rear seal seat, see Installation-09 Task 72-00-41-420-004.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

PWA 29855-3	Pin, Aligning (Two Are Necessary)
PWA 29855-5	Pin, Aligning (Two Are Necessary)
PWA 85070	Drift
PWA 85073	Ring, Retaining
PWA 85074	Spacer, Retaining

Consumable Materials:

	Item No.	Designation
	P03-001	Engine Oil (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-41-00/12/70
Gasket	12	72-41-00/12/210
Seal	1	72-41-00/12/60

C. Procedure
See Figure 402.

(1) Place No. 3 bearing rear seal seat (402/2), smaller diameter down on workbench.

(2) Install seal (402/3) into groove in ID of rear face of seal seat with open side of seal in rearward direction.

(3) Install PWA 85073 Retaining Ring to seal seat to retain seal in position.

 (a) Loosen three wing nuts on ring.

 (b) Position ring over top of seal seat.

 (c) Rotate three brackets on ring to locate slanted surface of seal seat. Tighten three wing nuts evenly to align ID of ring with ID of seal seat.

(4) With retaining ring installed, position seal seat, polished face rearward, over end of HPC rear shaft. Slide seal seat forward and seat on No. 3 bearing inner race using PWA 85070 Drift. Loosen wing nuts and rotate three bracket details of PWA 85073 Retaining Ring. Remove retaining ring from rear hub.

(5) Install new gasket (402/4) into groove in housing of No. 3 bearing rear (carbon) seal (402/10).

CAUTION: WHEN POSITIONING AND SEATING NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY ON NO. 3 BEARING SUPPORT, USE CAUTION TO PREVENT PINCHING GASKET BETWEEN FLANGE DIAMETERS.

(6) Install No. 3 bearing rear (carbon) seal (402/10).

 (a) Thread two equally spaced PWA 29855−3 Aligning Pins (402/11) into the front No. 3 bearing seal assembly inside the diffuser case.

 (b) Align offset holes and position seal on No. 3 bearing support in diffuser case.

 (c) Treat thread and shank of 40 bolts (402/5) with
R Antiseize Paste P06−054. Wipe off unwanted paste.

 (d) (Reference 980) Remove the two PWA 29855−3 Aligning Pins (402/11) as necessary and install the 40 treated bolts (402/5) to secure seal.

(e) Tighten bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m) in sequence specified in Figure 403. Without loosening bolts, repeat complete tightening sequence specified in Figure 403 two times.

WARNING: BE CAREFUL WHEN YOU USE A FREEZER/DRY-ICE TO COOL PARTS. USE SUITABLE GLOVES WHEN YOU TOUCH THE DRY-ICE OR THE COLD PARTS. THE DRY-ICE OR THE COLD PARTS CAN CAUSE BURNS.

(7) Chill front edge of No. 3 bearing cooling duct assembly (402/9) with dry ice before installation.

(8) Thread two equally spaced PWA 29855-5 Aligning Pins (402/12) into the threaded inserts of the No. 3 bearing rear (carbon) seal (402/10).

(9) Align boltholes and position No. 3 bearing cooling duct assembly (402/9) over No. 3 bearing rear seal.

(10) Remove the two PWA 29855-5 Aligning Pins (402/12) as necessary from the No. 3 bearing rear (carbon) seal (402/10). Attach the duct (402/9) using 12 gaskets (402/6), shouldered washers (402/7) and bolts (402/8) lubricated with Engine Oil P03-001.

(11) Torque the 12 bolts (402/8) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(12) Install PWA 85074 Spacer, larger ID first, over HPC rear hub and seat against No. 3 bearing rear seal seat. Lubricate threads at No. 3 bearing inner race
R retaining nut with Antiseize Paste P06-054. Wipe off
R unwanted paste. Install nut onto shaft to secure
spacer. Do not torque nut.

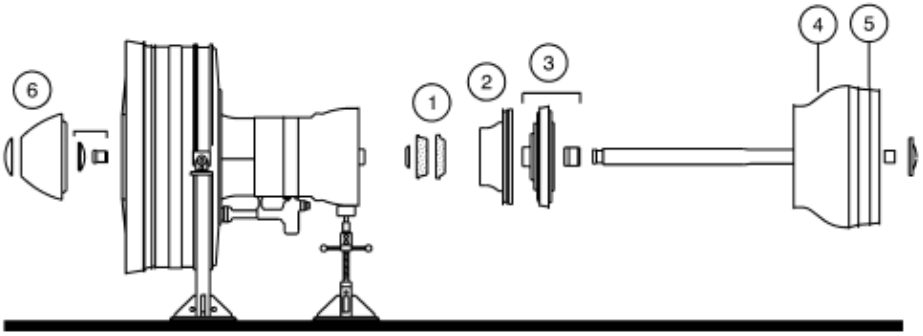
D. Postrequisites

(1) Vacuum check No. 3 bearing compartment per Inspection/ Check-07 Task 72-00-41-720-001.

(2) Install turbine nozzle per 72-00-51, Installation-01 Task 72-00-51-420-001.

(3) Test engine per Repair Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−03



1. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT
2. INSTALL TURBINE NOZZLE
3. INSTALL HIGH PRESSURE TURBINE
4. INSTALL LOW PRESSURE TURBINE
5. INSTALL TURBINE EXHAUST CASE
6. INSTALL COMPRESSOR INLET CONE

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-04

Task 72-00-41-450-001:

1. Install Exciter-To-Igniter Plug Cable, (Upper Plug-Upper Box)

A. Equipment And Materials Necessary

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-005	Cloth, Cotton Lint Free
P06-009	Compound, Antiseize (PMC 9523)
P06-021	Compound, Antigalling (PWA 550-3)
P06-036	Compound, Antigallant (PWA 36035) (Fel-Pro C-300)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Grommet	2	74-21-00/1/30
Rubber Bushings	2	74-21-00/X/XX
Ring	2	74-21-00/X/XX

B. Procedure
See Figure 401 and Figure 402.

CAUTION: SEE 72-00-00, INSTALLATION-00 (TASK 72-00-00-990-009) FOR GENERAL INSTALLATION OF ELECTRICAL HARNESSES, LEADS, AND CABLES.

(1) Remove protective caps from each end of cable and from mating output connector on upper ignition exciter.

CAUTION: DO NOT TWIST EXCITER-TO-IGNITER PLUG CABLE WHEN TURNING CONNECTOR NUT, OR DAMAGE TO CABLE COULD RESULT.

(2) If new rubber bushings are to be installed comply with the following:

(a) Clean bushings with clean Lint Free Cotton Cloth P05-005, and the SPOP 208 Wipe Method (Task 70-21-00-110-040).

(b) Slide treated rubber bushing with sleeve on cable wire and secure in place with new retaining ring.

(3) Install new grommet on cable ends as follows:

NOTE: This step is not applicable to new cable assemblies.

(a) Clean new grommet with clean Lint Free Cotton Cloth P05−005, and the SPOP 208 Wipe Method (Task 70−21−00−110−040).

(b) Slide grommet on cable.

(4) Place two clamps, smaller clamp first, over exciter end of cable.

(5) Install a clamp on the igniter plug end of the cable.

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(6) Lubricate the threads of the coupling nut at the igniter plug end of the cable with Antiseize Compound P06−009 and connect to the igniter plug. Keep the coupling nut loose sufficiently to permit free movement of the cable.

(7) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound P06−036 and connect the cable to the output connector on the exciter.

NOTE: When Antigalling Compound P06−036 is not available, an alternative of Antigalling Compound P06−021 can be used.

NOTE: Do not apply an excessive amount of compound to the cable coupling nut threads.

(8) Torque the coupling nuts on the cable until the nuts touch (bottom) on the shoulders of nuts. This torque usually is 140 − 160 lb−in. (15.818 − 18.078 N.m).

NOTE: Insufficient torque on cable nuts at exciter or igniter end can cause ignition radiated noise to be picked up by aircraft radio equipment.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−04

(9) (Reference 2151) (Pre SB PW4ENG 73−192) Position heat shield segments over exciter end of cable and secure with clamps. Torque clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(10) (Reference 2151) (Post SB PW4ENG 73−192) Position heat shield segments over exciter end of cable. Make sure the segment half with hose fittings is pointed up. Secure with clamps. Torque clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

(11) (Post SB PW4ENG 73−192) Install cooling hoses on heat shield fittings and secure with clamps. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

(12) (Reference 2151) Install heat shields at igniter plug. Bend tabs of igniter plug heat shield into groove in boss before securing clamp. Secure with clamp. Torque clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(13) Install cable clamp to upper cable. Lubricate bolt threads with Engine Oil P03−001 and secure cable clamp to bracket with bolt and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

(3) Install new grommet on cable ends as follows:

NOTE: This step is not applicable to new cable assemblies.

(a) Clean new grommet with clean Lint Free Cotton Cloth (P05−005), and the SPOP 208 Wipe Method (Task 70−21−00−110−040).
(b) Slide grommet on cable.
(4) Place two clamps, smaller clamp first, over exciter end of cable.
(5) Install a clamp on the igniter plug end of the cable.

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(6) Lubricate the threads of the coupling nut at the igniter plug end of the cable with Antiseize Compound (P06−009) and connect to the igniter plug. Keep the coupling nut loose sufficiently to permit free movement of the cable.
(7) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound (P06−036) and connect the cable to the output connector on the exciter.

NOTE: When Antigallant Compound (P06−036) is not available, an alternative of Antigalling Compound (P06−021) can be used.

Do not apply an excessive amount of compound to the cable coupling nut threads.

(8) Torque the coupling nuts on the cable until the nuts touch (bottom) on the shoulders of nuts. This torque usually is 140 − 160 lb−in. (15.818 − 18.078 N.m).

NOTE: Insufficient torque on cable nuts at exciter or igniter end can cause ignition radiated noise to be picked up by aircraft radio equipment.

(9) (Reference 2151) Position heat shield segments over exciter end of cable and secure with clamps. Torque clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(10) (Reference 2151) Install heat shields at igniter plug. Bend tabs of igniter plug heat shield into groove in boss before securing clamp. Secure with clamp. Torque clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(11) Install cable clamp to lower cable. Lubricate bolt threads with Engine Oil (P03−001) and secure cable clamp to bracket with bolt and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-41-450-003:

1. Install Fuel Distribution Valve

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-053	Lubricant, Seal Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	16	73-13-00/3/530
Packing	2	73-13-00/4/70

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) Install two packings lubricated with Seal Ring Lubricant P06-053, to eight transfer tubes. Install transfer tubes to each adapters on fuel supply tubes at Flange K bracket.

(3) Install packings, lubricated with Seal Ring Lubricant P06-053, to grooves in packing transfer tube assembly. Install valve transfer tube into distribution valve cover.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−06

(4) Install the fuel distribution valve over the eight (8) transfer tubes, aligning the forward mount bracket (Pre SB PW4ENG 73−163 only) with the bracket on Flange J. Secure the valve to the bracket on Flange K with four (4) bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) Secure valve to Flange J bracket with two bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(6) Translate transfer tube forward with dowel pin downward and boltholes aligned.

NOTE: If fuel flowmeter is installed, ensure seal plate is installed to rear flange of flowmeter and dowel pin is aligned.

(7) Install fuel flowmeter support over transfer tube aligning dowel pin on transfer tube with slot in support and aligning boltholes in rear (larger) flange. Install bracket over support and position as shown in Figure 401.

(8) Secure rear flange with bolts (without drilled heads) threads lubricated with Engine Oil P03−001. Secure front flange with drilled head bolts, threads lubricated with Engine Oil P03−001.

(9) Torque all bolts at front and rear flanges to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts on the front flange.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Fuel Distribution Valve
Figure 401
(Task 72−00−41−450−003)

Task 72-00-41-450-004:

1. Install Igniter Plug

A. General

(1) This procedure applies to either igniter plug and is used only for installation of plug and/or key washer. If boss and/or spacers are to be replaced, see Installation-08.

B. Equipment And Materials Required

Consumable Material:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-005	Cloth, Cotton Lint Free
	P06-009	Compound, Antiseize (PMC 9523)
	P06-021	Compound, Antigalling (PWA 550-3)
R	P06-023	Lubricant, Thread (PWA 36001)
	P06-036	Compound, Antigallant (PWA 36035) (Fel-Pro C-300)
	P11-027	Solvent, Petroleum (PMC 9001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	74-21-00/2/20
Grommet	2	74-21-00/1/30

C. Procedure
See Figure 401.

(1) If key washer was removed, install new key washer on boss. Bend tabs of key washer to secure to boss.

R (2) Fully clean the igniter plug threads and boss threads
R with Petroleum Solvent P11-027 to remove carbon
R deposits and thread lubricants.

R CAUTION: DO NOT USE THREAD LUBRICANT P06-023 (SILVER
R GOOP) ON THE IGNITER PLUG THREADS IF A
R DIFFERENT COMPOUND WAS APPLIED BEFORE. MAKE
R SURE THAT YOU REMOVE THE ANTISEIZE COMPOUND
R FULLY BEFORE YOU APPLY THREAD LUBRICANT
R (SILVER GOOP). IF YOU USE THE THREAD
R LUBRICANT (SILVER GOOP) WHERE A DIFFERENT

R COMPOUND WAS APPLIED BEFORE, IT CAN BECOME
R HARD AFTER ENGINE OPERATION.

R (3) Apply Thread Lubricant P06-023 to the igniter plug
R threads. Apply Antiseize Compound P06-009 to the
R threads of cable connector.

NOTE: Do not apply an excessive amount of lubricant to the threads of the cable connector.

(4) (Reference 401) Install igniter plug. Keep igniter plug boss from turning while tightening igniter plug. Torque plug to 300 - 360 lb-in. (33.895 - 40.675 N.m).

(5) Remove protective caps from ends of igniter cable and connector on the exciter.

(6) Check cable contact for evidence of arcing (discoloration and heavy pitting). Check cable ends for evidence of carbon tracking. Replace cable if either condition is found. See Installation-04 and -05.

(7) Install new grommet on cable end as follows:

  (a) Clean new grommet with clean Lint Free Cotton Cloth P05-005, and the SPOP 208 Wipe Method (Task 70-21-00-110-040).

  (b) Slide grommet on cable.

(8) Install two clamps, smaller clamp first, on the exciter end of the cable.

(9) Install a clamp on the igniter plug end of the cable.

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(10) Connect the coupling nut of the igniter plug end of the cable to the igniter plug. Keep the coupling nut loose sufficiently to permit free movement of the cable.

(11) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound P06-036 and connect the cable to the output connector on the exciter.

NOTE: When Antigallant Compound P06-036 is not available, an alternative of Antigalling Compound P06-021 can be used.

NOTE: Do not apply an excessive amount of compound to the cable coupling nut threads.

(12) Torque the coupling nuts on the cable until the nuts touch (bottom) on the shoulder of nuts. This torque is usually 140 - 160 lb-in. (15.818 - 18.078 N.m).

(13) Install heat shield segments at igniter end of exciter-to-igniter plug cable and reposition securing clamp. Bottom heat shield on igniter plug boss.

(14) (Reference 2151) Torque clamp screw to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(15) (Reference 2151) Install the heat shields segments at the exciter end of the cable. Put the clamps over the heat shields and torque the clamp screws to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(16) Install the bolt, threads lubricated with Engine Oil P03-001, and nut that attaches a clamp on the igniter cable (the upper or lower cable as necessary) to a bracket located between the upper and lower igniter cable. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

D. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Igniter Plug Replacement
Figure 401
(Task 72-00-41-450-004)

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-08

Task 72-00-41-450-005:

1. Install Igniter Plug, Igniter Plug Boss And Exciter-To-Igniter Cable

A. General

(1) This procedure applies to both igniter plug locations. If boss or spacer(s) are to be replaced, and parts removed at disassembly are available, use this procedure to check boss and spacer thickness. If none of the above parts are to be replaced, install igniter plug per Installation-07.

(2) If boss or spacer(s) are to be replaced, and parts removed at disassembly are not available, igniter plug immersion depth must be determined per Installation-14.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-005	Cloth, Cotton Lint Free
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-009	Compound, Antiseize (PMC 9523)
P06-021	Compound, Antigalling (PWA 550-3)
P06-023	Lubricant (PWA 36001)
P06-036	Compound, Antigallant (PWA 36035) (Fel-Pro C-300)
P11-027	Solvent, Petroleum (PMC 9001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	74-21-00/2/20
Grommet	2	74-21-00/1/30

C. Procedure

See Figure 401.

(1) If key washer is being replaced, install new key washer to boss and bend tabs of key washer around flange of boss to secure in place.

(2) If igniter boss and/or classified spacers have been removed but will not be replaced continue with installation procedure step (3). If igniter boss and/or spacers are being replaced, check boss and spacer thickness and adjust classified spacer thickness, if necessary as follows:

(a) Install classified spacer(s) to boss and measure total thickness of parts shown in Figure 401, Dimension A.

(b) Compare total thickness of parts with identical dimension of old parts obtained at disassembly. If the assembly dimension is within plus or minus 0.015 inch (0.381 mm) of disassembly dimension, no spacer adjustment is required. If assembly dimension is NOT within 0.015 inch (0.381 mm) of disassembly dimension select one or more classified spacers to equal disassembly dimension within plus or minus 0.010 inch (0.254 mm). See Figure 402. Use a maximum of two spacers per each igniter plug location.

NOTE: Total combined thickness of spacers is not to exceed 0.300 inch (7.620 mm) at each igniter location.

(3) Fully clean plug threads and boss threads with Petroleum Solvent P11−027 to remove carbon deposits and thread lubricants.

(4) Lubricate OD threads of boss with Lubricant P06−023.

(5) (Reference 400) Install classified spacer(s) to boss and install boss to diffuser case. Torque boss to 375 − 440 lb−in. (42.869 − 49.713 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(6) Apply Lubricant P06−023, to threads of igniter plug.

NOTE: Do not apply an excessive amount of lubricant to the threads of the igniter plug.

(7) (Reference 401) Install igniter plug to boss. Torque plug to 300 - 360 lb-in. (33.895 - 40.675 N.m).

NOTE: Keep igniter plug boss from turning while torquing plug.

(8) Remove protective caps from end of igniter plug cable ends and the connector on the exciter.

(9) Check cable contact for evidence of arcing (discoloration and heavy pitting). Check cable ends for evidence of carbon tracking. Replace the cable if either condition is found. See 72-00-41, Removal-04 Task 72-00-41-050-001 or Removal-05 Task 72-00-41-050-002 and Installation-04 Task 72-00-41-450-001 or Installation-05 Task 72-00-41-450-002.

(10) Install new grommet on cable ends as follows:

(a) Clean the new grommet with clean Lint Free Cotton Cloth P05-005, and SPOP 208. See the Standard Practices Manual, PN 585005.

(b) Slide grommet on cable.

(c) Apply Antiseize Compound P06-009, to threads of cable connector on the igniter plug end of the cable.

NOTE: Do not apply an excessive amount of lubricant to the threads of the cable connector.

(11) Install two clamps, smaller clamp first, over exciter end of the cable.

(12) Install a clamp on the igniter plug end of the cable.

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(13) Connect the coupling nut of the igniter plug end of the cable to the igniter plug. Keep the coupling nut loose sufficiently to permit free movement of the cable.

(14) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound P06−036 and connect the cable to the output connector on the exciter.

NOTE: When Antigallant Compound P06−036 is not available, an alternative of Antigalling Compound P06−021 can be used.

NOTE: Do not apply an excessive amount of compound to the cable coupling nut threads.

(15) Torque the coupling nuts on the cable until the nuts touch (bottom) on the shoulder of nuts. This torque is usually 140 − 160 lb−in. (15.818 − 18.078 N.m).

(16) Install heat shield segments at igniter plug end of exciter−to−igniter plug cable and reposition securing clamp. Bottom heat shield on igniter plug boss.

(17) (Reference 2151) Torque clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(18) (Reference 2151) Install the heat shields segments at the exciter end of the cable. Put the clamps over the heat shields and torque the clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(19) Install the bolt, threads lubricated with Engine Oil P03−001, and nut that attaches a clamp on the igniter cable (the upper or lower cable as necessary) to a bracket located between the upper and lower igniter cable. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

D. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Spacer Classification Data

Igniter Boss Classified Spacer
Figure 402
(Task 72-00-41-450-005)

Task 72-00-41-420-004:

1. Install No. 3 Bearing Rear Seal Assembly And Rear Seal Seat (Vertical)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: For horizontal installation of No. 3 bearing rear seal assembly and rear seal seat, see Installation-03 Task 72-00-41-420-003.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

PWA 29855-3	Pin, Aligning (Two Are Necessary)
PWA 29855-5	Pin, Aligning (Two Are Necessary)
PWA 85070	Drift
PWA 85073	Ring, Retaining
PWA 85074	Spacer, Retaining

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-41-00/12/70
Seal	1	72-41-00/12/60

C. Procedure
See Figure 402.

(1) Place No. 3 bearing rear seal seat (402/8), smaller diameter down on workbench.

(2) Install seal (402/7) into groove in ID of rear face of seal seat.

(3) Install PWA 85073 Retaining Ring to seal seat.

  (a) Loosen three wing nuts on ring.

  (b) Position ring over top of seal seat.

  (c) Rotate three brackets on ring to locate slanted machined surface on seal seat. Tighten three wing nuts evenly to align ID of ring with ID of seal seat.

(4) Remove thread protector from end of HPC rear hub.

(5) With retaining ring installed, position seal seat, polished face rearward, over end of HPC rear shaft. Slide seal seat forward and seat on No. 3 bearing inner race using PWA 85070 Drift . Loosen wing nuts and rotate three bracket details of PWA 85073 Retaining Ring. Remove retaining ring from seal seat.

(6) Install new gasket (402/6) into groove in No. 3 bearing (carbon) seal (402/5).

  CAUTION: WHEN POSITIONING AND SEATING NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY ON NO. 3 BEARING SUPPORT, USE CAUTION TO PREVENT PINCHING GASKET BETWEEN FLANGE DIAMETERS.

(7) Install No. 3 bearing rear (carbon) seal (402/5).

  (a) Thread two equally spaced PWA 29855−3 Aligning Pins (402/12) into the front No. 3 bearing seal assembly inside the diffuser case.

  (b) Align offset holes and position seal on No. 3 bearing support in diffuser case.

  (c) Treat thread and shank of 40 bolts (402/10) with
R Antiseize Paste P06−054. Wipe off unwanted paste.

  (d) (Reference 980) Remove the two PWA 29855−3 Aligning Pins (402/12) as necessary and install the 40 treated bolts to secure seal.

(e) Tighten the 40 bolts (402/10) to 125 - 140 lb-in. (14.123 - 15.818 N.m) in sequence specified in Figure 403. Without loosening bolts, repeat complete tightening sequence specified in Figure 403 two times.

WARNING: BE CAREFUL WHEN YOU USE A FREEZER/DRY-ICE TO COOL PARTS. USE SUITABLE GLOVES WHEN YOU TOUCH THE DRY-ICE OR THE COLD PARTS. THE DRY-ICE OR THE COLD PARTS CAN CAUSE BURNS.

(8) Chill front edge of No. 3 bearing cooling duct assembly (402/4) with dry ice before installation.

(9) Thread two equally spaced PWA 29855-5 Aligning Pins (402/11) into the threaded inserts of the No. 3 bearing rear (carbon) seal (402/5).

(10) Align boltholes and position No. 3 bearing cooling duct assembly (402/4) over No. 3 bearing rear seal. Tap lightly to seat.

(11) Remove the two PWA 29855-5 Aligning Pins (402/11) as necessary from the No. 3 bearing rear (carbon) seal (402/5). Attach duct using 12 gaskets (402/3), shouldered washers (402/2) and bolts (402/1) lubricated with Engine Oil P03-001.

(12) Torque the 12 bolts (402/1) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

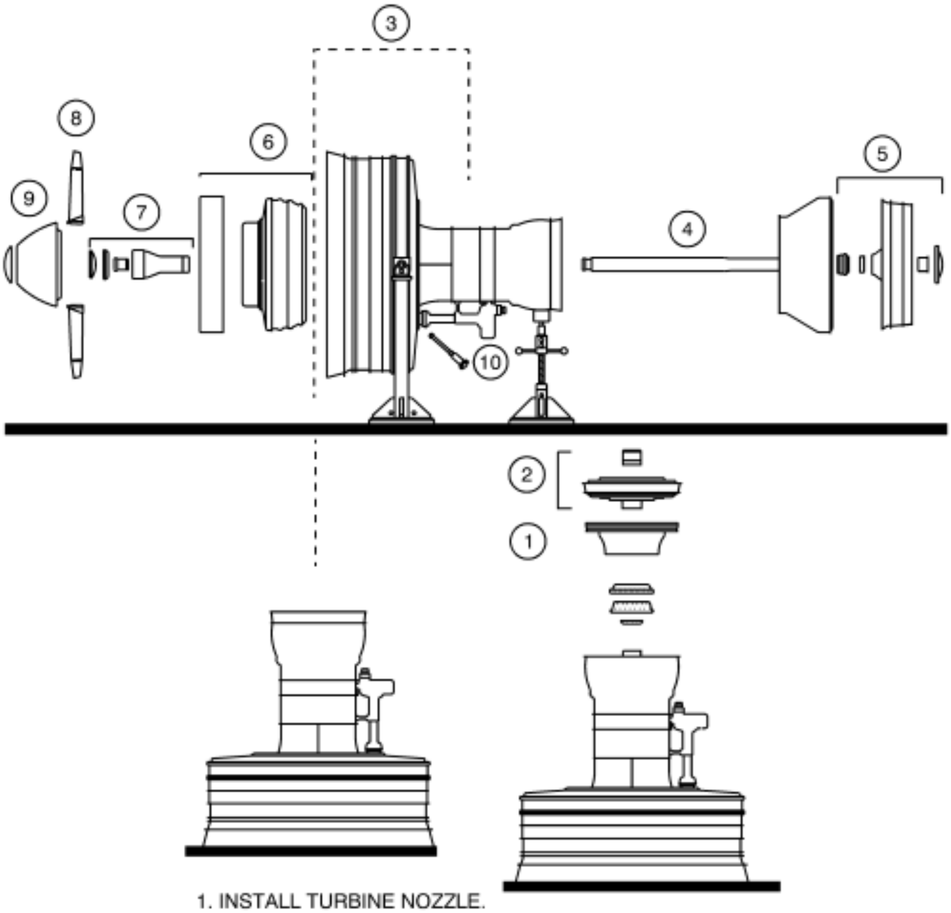
(13) Install PWA 85074 Spacer, larger ID first, over HPC rear hub and seat against No. 3 bearing rear seal seat. Lubricate threads at No. 3 bearing inner race
R retaining nut with Antiseize Paste P06-054. Wipe off
R unwanted paste. Install nut onto shaft to secure spacer. Do not torque nut.

D. Postrequisite Procedures

(1) Install turbine nozzle per 72-00-51, Installation-02 Task 72-00-51-420-002.

(2) Test engine per Repair Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−09



1. INSTALL TURBINE NOZZLE.
2. INSTALL HIGH PRESSURE TURBINE (HPT).
3. TRUNNION FAN CASES THROUGH HPT TO HORIZONTAL.
4. INSTALL LOW PRESSURE TURBINE (LPT).
5. INSTALL TURBINE EXHAUST CASE.
6. INSTALL LOW PRESSURE COMPRESSOR (LPC).
7. INSTALL LPC/LPT COUPLING.
8. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
9. INSTALL COMPRESSOR INLET CONE.
10. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-10

Task 72-00-41-460-001:

1. Install Fuel Distribution Valve Strainer

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-053	Lubricant, Seal Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	73-13-00/4/70
Packing	1	73-13-00/5/10
Packing	1	73-13-00/5/30

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) Install packing lubricated with Seal Ring Lubricant P06-053, to groove on rearward end of strainer and install fuel strainer to ID of fuel distribution valve.

(3) Install two packings lubricated with Seal Ring Lubricant P06-053, to grooves in packing transfer tube assembly. Install valve transfer tube into valve cover.

(4) Install packing lubricated with Seal Ring Lubricant P06-053, to cover and install cover to fuel distribution valve housing. Secure cover with bolts threads lubricated with Engine Oil P03-001. Torque bolts to 30 - 33 lb-in. (3.390 - 3.728 N.m).

(5) Translate transfer tube forward with dowel pin and boltholes aligned.

NOTE: Ensure sealplate is installed against rear flange of fuel flowmeter and dowel pin is aligned.

(6) Install the fuel flowmeter support over the transfer tubes, aligning the dowel pin on the transfer tube with the slot in the support. Align the bolt holes in the rear (larger) flange. Install the bracket (Pre SB PW4ENG 73−163 only) over the support and position it as shown in Figure 401.

(7) Secure rear flange with bolts (without drilled heads) lubricated with Engine Oil P03−001. Secure front flange with drilled head bolts lubricated with Engine Oil P03−001.

(8) Torque all bolts at front and rear flanges to 85 − 95 lb−in. 9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at the front flange.

C. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 72−00−41−990−003.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-11

Task 72-00-41-420-011:

1. Install Combustion Chamber (Outer) (Horizontal)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85079	Fixture, Handling
PWA 85060	Pin, Alignment

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-023	Lubricant (PWA 36001)

C. Procedure
See Figure 402.

CAUTION: WHEN PN 50J488 OUTER COMBUSTION CHAMBER IS INSTALLED PN 50K488 INNER COMBUSTION CHAMBER MUST ALSO BE INSTALLED.

(1) Position outer combustion chamber on its side, with two igniter plug holes at approximately 4 o'clock position as viewed from the rear. Locate 12 o'clock position on the combustion chamber.

(2) Attach overhead hoist to PWA 85079 Fixture and position fixture over combustion chamber.

(3) Loosen two hand knobs on fixture to open clamping plate and position inside the combustion chamber at the 12 o'clock position.

(4) Locate the first step in the clamping plate to the outer rear flange of the combustion chamber and tighten the two hand knobs.

(5) Install three PWA 85060 Alignment Pins equally spaced to bosses on the outer diameter of diffuser case and retract the inner portion of the pins.

(6) Install the combustion chamber into the diffuser case and push the inner portion of the pins in to align the combustion chamber mount lugs with the diffuser case at three places.

(7) Lubricate the threads and seating surface of the twelve doweled end retaining bolts with Lubricant P06−023 and wipe clean any lubricant from other bolt surfaces before installation. Install nine lubricated bolts and washers through the outside of diffuser case to locate the combustion chamber mount lugs. Wipe clean any excess lubricant from the case and/or bolt surfaces.

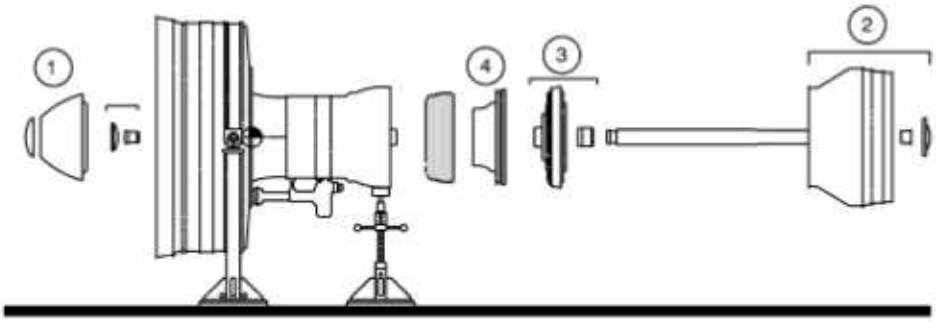
(8) Remove one pin at a time and install the three remaining bolts and washers. (Reference 402). Torque twelve bolts 500 − 600 lb−in. (56.492 − 67.791 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

D. Postrequisites

(1) Install igniter plugs. See 72−00−41, Installation−07 Task 72−00−41−450−004.

(2) Install turbine nozzle − horizontal. See 72−00−51, Installation−01 Task 72−00−51−420−001.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−11



1. REMOVE COMPRESSOR INLET CONE.
2. REMOVE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE.
3. REMOVE HIGH PRESSURE TURBINE.
4. REMOVE TURBINE NOZZLE.

Task 72-00-41-420-012:

1. Install Diffuser And Combustor (Horizontal) With No. 3 Bearing Outer Race Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-16 Task 72-00-41-420-014 for alternate procedure requiring installation of No. 3 bearing outer race into diffuser combustor group after being installed on HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

(2) For diffuser and combustors that were fully disassembled, assemble the diffuser and combustor by means of 72-41-00, Assembly-01 Task 72-41-00-400-001. For diffuser and combustors with only the No. 3 bearing outer race removed, assemble the diffuser and combustor by 72-41-00, Installation-01 Task 72-41-00-430-001.

B. Equipment And Materials Required

Standard Tools:
0.250-28 Jackscrew (Four Required)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 26157	Pedestal (Optional To PWA 87359)
PWA 28657	Sling
PWA 29606	Control, Heater (Optional To PWA 29754)
PWA 29754	Control, Heater
PWA 76154	Adapter
PWA 85056	Cover (Optional To PWA 85802)
PWA 85062	Saddle
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift

Special Tools:

(CONTINUED)

PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin (Three Required)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Brackets
PWA 85795	Heater
PWA 85802	Cover
PWA 85893	Support
PWA 85909	Adapter
PWA 85910	Adapter
PWA 85926	Cooler
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 87359	Pedestal
PWA 105513	Heater, Electric (For HPC With The Ring Style Case, Post SB PW4ENG 72−756 Or SB PW4ENG 72−759 As Applicable)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−059	Wax, Paraffin (PMC 9552)
P05−102	Ice, Dry
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
R P05−292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−41/1/1

C. Procedure
See Figure 402.

(1) Remove PWA 85159 Thread Protector and PWA 85428 Knife Edge Protector from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(2) Visually inspect HPC rear drum OD thrust balance knife-edge per 72-00-35, Inspection/Check-02 (visual only) Task 72-00-35-210-004. Reject the airseal with cracks confirmed by visual inspection.

(3) Measure thickness of No. 3 bearing front seal seat across (402/3) thinner, ID, section of seal seat. Measure No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/1) thickness. Record this total thickness as Dimension A.

(4) Measure distance from end of HPC rear hub (402/4) down to seal seat shoulder (402/5) on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(5) Install three PWA 85310 Alignment Pins into rear flange of HPC case. See Figure 403 and Figure 404.

(a) Locate three equally spaced 0.250-28 jackscrew holes in HPC rear flange.

(b) Insert three alignment pins (dowel pins rearward) through unthreaded holes in rear Flange K of HPC case. Secure pins with detail screws.

(6) For engines with a gasket groove on the rear flange of the HPC rear case (Post SB PW4ENG 72-48 and Pre SB PW4ENG 72-756), install gasket to the flange groove and hold in place with Paraffin Wax P05-059. See Figure 403.

NOTE: Engines Pre SB PW4ENG 72-48 and Post SB PW4ENG 72-756 do not accept gasket at Flange K.

(7) For engines with the ring style case (Post SB PW4ENG 72−756 or SB PW4ENG 72−759), use a PWA 105513 Heater to heat the HPC rear case rear flange as follows:

(a) Move the clamp block outboard until it is clear of the HPC rear case rear flange.

(b) Make sure that the thermocouple is in its stored position Adapter as stamped on the tool to prevent damage.

(c) Carefully move the Heater over the HPC rear shaft and engage the six Locator details on the rear case rear flange.

(d) Move the clamp block inboard and tighten the plastic knob.

(e) Move the thermocouple from its stored position adapter to its side of the heater adapter and let it contact the HPC rear case rear flange.

(f) Connect the Heater to the PWA 29606 or PWA 29754 Control.

(g) Heat the HPC rear case rear flange to 300°F (149°C).

(h) When the rear flange is at the correct temperature turn off the Controller.

(i) Put the thermocouple is in its stored position Adapter as stamped on the tool.

(j) Loosen the plastic knob and move the clamp block outboard.

(k) Carefully remove the Heater from the HPC rear case.

(8) Position PWA 85308 Guide or PWA 85701 Guide, larger diameter end first, on HPC rear hub and seat.

(9) Install two PWA 85751 Handling Brackets to diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

(10) Install two PWA 76154 Adapters to spools on PWA 85751 Brackets and attach PWA 28657 Sling and overhead hoist to PWA 76154 Adapters .

(11) With hoist position diffuser combustor behind HPC rear hub. Align dowel pins in HPC rear case with mating holes in diffuser case. With workbolts and nuts, seat diffuser case on HPC rear case. See Figure 405.

(12) Remove PWA 85308 Guide or PWA 85701 Guide from HPC rear hub. See Figure 404.

(13) Position PWA 85062 Saddle and either PWA 87359 Pedestal or PWA 26157 Pedestal at Flange M at rear of diffuser case.

(14) Remove PWA 85390 Lifting Adapter and hoist from high compressor 8th stage bleed pads.

(15) Remove PWA 28657 Sling, PWA 76154 Adapters, and PWA 85751 Brackets.

(16) Install the Flange K hardware as follows. Refer to 72-00-41, Installation-20 (Task 72-00-41-420-020).

(17) Install PWA 85802 Protector Cover or PWA 85056 Protector Cover (406/5) over No. 3 bearing outer race retaining nut installed in housing. If PWA 85056 Protector Cover is used, slowly rotate cover until the three spring plungers seat in holes in retaining nut.

(18) Assemble PWA 85067 Fixture to No. 3 bearing front seal seat. See Figure 406.

(19) Install fixture with seal seat, polished face forward over HPC rear hub and drift to seat if necessary. Remove fixture.

(20) Assemble PWA 85068 Fixture to No. 3 bearing seal spacer.

(21) Install fixture with seal spacer over HPC rear hub and drift to seat if necessary. Remove fixture.

(22) Remove PWA 85168 Protector from diffuser case. See Figure 407.

(23) Remove PWA 85802 Protector Cover or PWA 85056 Protector Cover from housing.

(24) Chill HPC hub with PWA 85926 Cooler with Dry Ice P05−102.

(25) Install cooler in HPC hub and attach shop air to cooler.

(26) Heat No. 3 bearing outer race with PWA 85795 Heater or PWA 85679 Heater and PWA 29754 Control or equivalent.

(27) Remove three hex head cap screws with washers from storage holes in heater and attach heater to diffuser case flange with cap screws.

(28) After parts are properly heated and chilled, remove heater and cooler.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(29) Install No. 3 bearing inner race and rollers onto HPC rear hub, puller groove out. Seat bearing with PWA 85070 Drift.

(30) Install PWA 85168 Protector in diffuser case.

(31) Allow hub and bearing to return to room temperature. With depth gage measure distance from end of HPC rear hub into rear of inner race and rollers. Record this distance as Dimension C. See Figure 402.

(32) Dimension C must not be less than previously taken Dimension B minus Dimension A. See Figure 402.

NOTE: Dimension C less than required indicates bearing is not fully seated.

(33) Remove PWA 85893 Support (407/2) and PWA 85909 Adapter (407/1) or PWA 85910 Adapter if used as an alternate to PWA 85909 Adapter. See Figure 408.

(34) Install PWA 85159 Thread Protector over HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To Complete Installation Of Diffuser Combustor. Refer to 72-00-41, Installation-02 (Task 72-00-41-420-002).

(2) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(3) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(4) Install The Turbine Nnozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(5) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(6) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(7) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(8) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(9) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(10) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(11) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

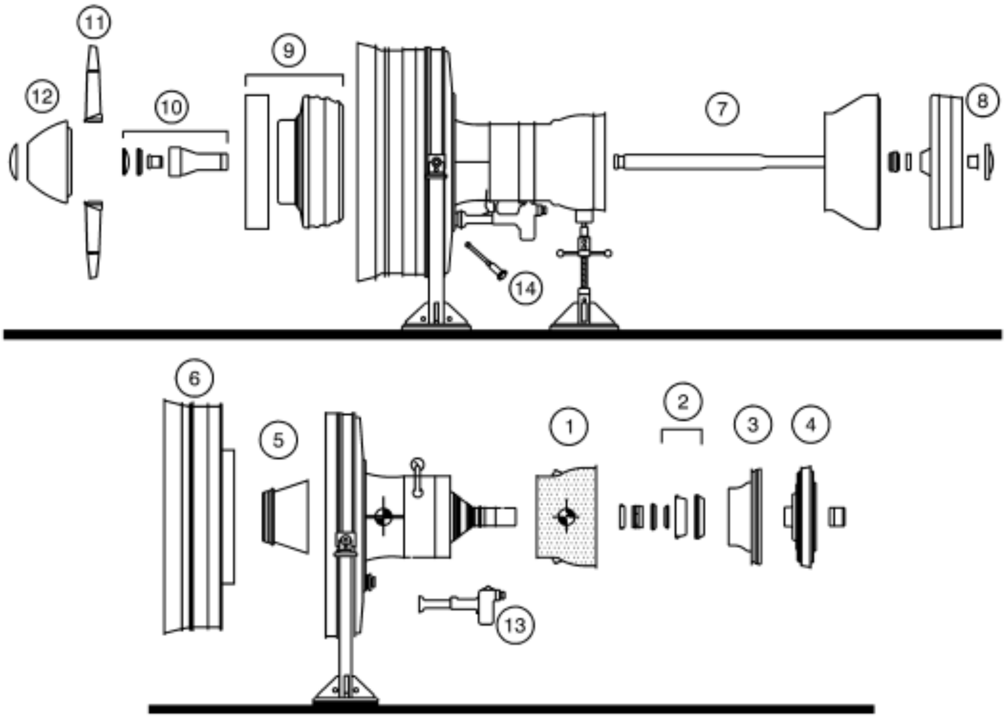
(12) Install The Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72−00−31−420−002−002).

(13) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(14) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001).

(15) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−12



1. INSTALL DIFFUSER AND COMBUSTOR.
2. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
3. INSTALL TURBINE NOZZLE.
4. INSTALL HIGH PRESSURE TURBINE (HPT).
5. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
6. INSTALL FAN CASE.
7. INSTALL LOW PRESSURE TURBINE (LPT).
8. INSTALL TURBINE EXHAUST CASE.
9. INSTALL LOW PRESSURE COMPRESSOR (LPC).
10. INSTALL LPC/LPT COUPLING.
11. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
12. INSTALL COMPRESSOR INLET CONE.
13. INSTALL MAIN GEARBOX.
14. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSTALLATION-12

Task 72-00-41-420-014:

1. Install Diffuser And Combustor (Horizontal) With No. 3 Bearing Outer Race Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-16 Task 72-00-41-420-019 for the applicable procedure necessary for the installation of the No. 3 bearing outer race into the diffuser combustor group after installation onto the HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures show where necessary in the text that follows and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

(2) For diffuser and combustors that were fully disassembled, assemble the diffuser and combustor by 72-41-00, Assembly-01 Task 72-41-00-400-001. For diffuser and combustors with only the No. 3 bearing outer race removed, assemble the diffuser and combustor by 72-41-00, Installation-01 Task 72-41-00-430-001.

B. Equipment And Materials Necessary

Standard Tools:

0.250-28 Jackscrew (Four Necessary)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 26157	Pedestal (Optional To PWA 87359)
PWA 28657	Sling
PWA 29606	Control, Heater (Optional To PWA 29754)
PWA 29754	Control, Heater
PWA 76154	Adapter
PWA 85056	Cover (Optional To PWA 85802)
PWA 85062	Saddle
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift

Special Tools:

(CONTINUED)

PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin (Three Necessary)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Brackets
PWA 85795	Heater
PWA 85802	Cover
PWA 85893	Support
PWA 85909	Adapter
PWA 85910	Adapter
PWA 85926	Cooler
PWA 85983	Adapter, Stabilizer (Two Necessary Twin Overhead Rail System Only)
PWA 87359	Pedestal
PWA 105513	Heater, Electric (For HPC With The Ring Style Case, Post SB PW4ENG 72-756 Or SB PW4ENG 72-759 As Applicable)

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-059	Wax, Paraffin (PMC 9552)
	P05-102	Ice, Dry
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-00-41/1/1

C. Procedure
See Figure 402.

(1) Remove the PWA 85159 Thread Protector and PWA 85428 Knife-Edge Protector from the HPC rear hub.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT DAMAGE.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THE THINNER, ID, SECTION OF THE SEAL SEAT OR AN INCORRECT DIMENSION WILL RESULT.

(2) Make a visual inspection of the HPC rear drum OD thrust balance knife−edge by 72−00−35, Inspection/Check−02 (visual only) Task 72−00−35−210−004. Reject the airseal with cracks found by visual inspection.

(3) Measure the thickness of the No. 3 bearing front seal seat across (402/3) the thinner, ID, section of the seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness and the No. 3 bearing inner race and rollers (402/1) thickness. Make a record of this total thickness as Dimension A.

(4) Measure the distance from the end of the HPC rear hub (402/4) down to the seal seat shoulder (402/5) on the hub. Make a record this dimension as Dimension B.

NOTE: Dimensions A and B are used to do a seating check later during this installation procedure.

(5) Install three PWA 85310 Alignment Pins into the rear flange of the HPC case. See Figure 403 and Figure 404.

(a) Locate three equally spaced 0.250−28 jackscrew holes in the HPC rear flange.

(b) Insert three alignment pins (dowel pins rearward) through the unthreaded holes in the rear of Flange K of the HPC case. Attach the pins with the detail screws.

(6) For engines with a gasket groove on the rear flange of the HPC rear case (Pre SB PW4ENG 72−756 or SB PW4ENG 72−759), install a gasket to the flange groove and hold in place with Paraffin Wax P05−059. See Figure 403.

(7) For engines with the ring style case, (Post SB PW4ENG 72−756 or SB PW4ENG 72−759), use a PWA 105513 Heater to heat the HPC rear case rear flange as follows:

(a) Move the clamp block outboard until it is clear of the HPC rear case rear flange.

(b) Make sure that the thermocouple is in its stored position Adapter as stamped on the tool to prevent damage.

(c) Carefully move the Heater over the HPC rear shaft and engage the six Locator details on the rear case rear flange.

(d) Move the clamp block inboard and tighten the plastic knob.

(e) Move the thermocouple from its stored position adapter to its side of the heater adapter and let it contact the HPC rear case rear flange.

(f) Connect the Heater to the PWA 29606 or PWA 29754 Control.

(g) Heat the HPC rear case rear flange to 300°F (149°C).

(h) When the rear flange is at the correct temperature turn off the Controller.

(i) Put the thermocouple is in its stored position Adapter as stamped on the tool.

(j) Loosen the plastic knob and move the clamp block outboard.

(k) Carefully remove the Heater from the HPC rear case.

(8) Install the PWA 85308 Guide or PWA 85701 Guide, larger diameter end first, to the HPC rear hub and engage on the seal seat shoulder.

(9) Install two PWA 85751 Handling Brackets to the diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations. Install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket to the rear most two holes as marked on the bracket.

(10) Install two PWA 76154 Adapters to the spools on the PWA 85751 Brackets and attach the PWA 28657 Sling and overhead hoist to the PWA 76154 Adapters.

(11) Use a hoist and install the diffuser and combustor assembly over the HPC rear hub. Align the dowel pins in the HPC rear case with the holes in the diffuser case. With workbolts and nuts, seat the diffuser case on the HPC rear case.

(12) Remove the PWA 85308 Guide or PWA 85701 Guide from the HPC rear hub. See Figure 404.

(13) Install the PWA 85062 Saddle and the PWA 87359 Pedestal or PWA 26157 Pedestal at Flange M at the rear of the diffuser case.

(14) Remove the PWA 85390 Lifting Adapter and hoist from the high compressor 8th stage bleed pads.

(15) Remove the PWA 28657 Sling, PWA 76154 Adapters and the PWA 85751 Brackets.

(16) Install the Flange K hardware as follows. Refer to 72−00−41, Installation−20 (Task 72−00−41−420−020).

(17) Install the PWA 85802 Protector Cover or PWA 85056 Protector Cover (406/5) over the No. 3 bearing outer race retaining nut installed in the housing. If PWA 85056 Protector Cover is used, slowly turn the cover until the three spring plungers engage in the holes in retaining nut.

(18) Assemble the PWA 85067 Fixture to the No. 3 bearing front seal seat. See Figure 406.

(19) Install the fixture with seal seat, polished face forward over the HPC rear hub and drift to seat if necessary. Remove the fixture.

(20) Assemble the PWA 85068 Fixture to the No. 3 bearing seal spacer.

(21) Install the fixture with the seal spacer over HPC rear hub and drift to seat if necessary. Remove fixture.

(22) Remove the PWA 85168 Protector from the diffuser case. See Figure 407.

(23) Remove the PWA 85802 Protector Cover or PWA 85056 Protector Cover from the housing.

(24) Chill the HPC hub with the PWA 85926 Cooler and Dry Ice P05−102.

(25) Install the cooler in the HPC hub and attach shop air to the cooler.

(26) Heat the No. 3 bearing outer race with the PWA 85795 Heater or PWA 85679 Heater and PWA 29754 Control or equivalent.

(27) Remove three hex head cap screws with washers from the storage holes in the heater and attach the heater to the diffuser case flange with cap screws.

(28) After parts are correctly heated and chilled, remove the heater and cooler.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(29) Install the No. 3 bearing inner race and rollers onto the HPC rear hub, puller groove out. Seat the bearing with the PWA 85070 Drift.

(30) Install the PWA 85168 Protector in the diffuser case.

(31) Permit the hub and bearing to return to room temperature. With a depth gage measure the distance from the end of HPC rear hub into the rear of the inner race and rollers. Make a record of this distance as Dimension C. See Figure 402.

(32) Dimension C must not be less than Dimension B minus Dimension A. See Figure 402.

NOTE: An indication that the bearing is not fully seated is when Dimension C is less than necessary.

(33) Remove the PWA 85893 Support (407/2) and PWA 85909 Adapter (407/1) or PWA 85910 Adapter if used as an option to the PWA 85909 Adapter. See Figure 408.

(34) Install the PWA 85159 Thread Protector over the HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To Complete Installation Of Diffuser Combustor. Refer to 72-00-41, Installation-02 (Task 72-00-41-420-002).

(2) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(3) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(4) Install The Turbine Nnozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(5) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(6) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(7) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(8) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(9) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(10) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

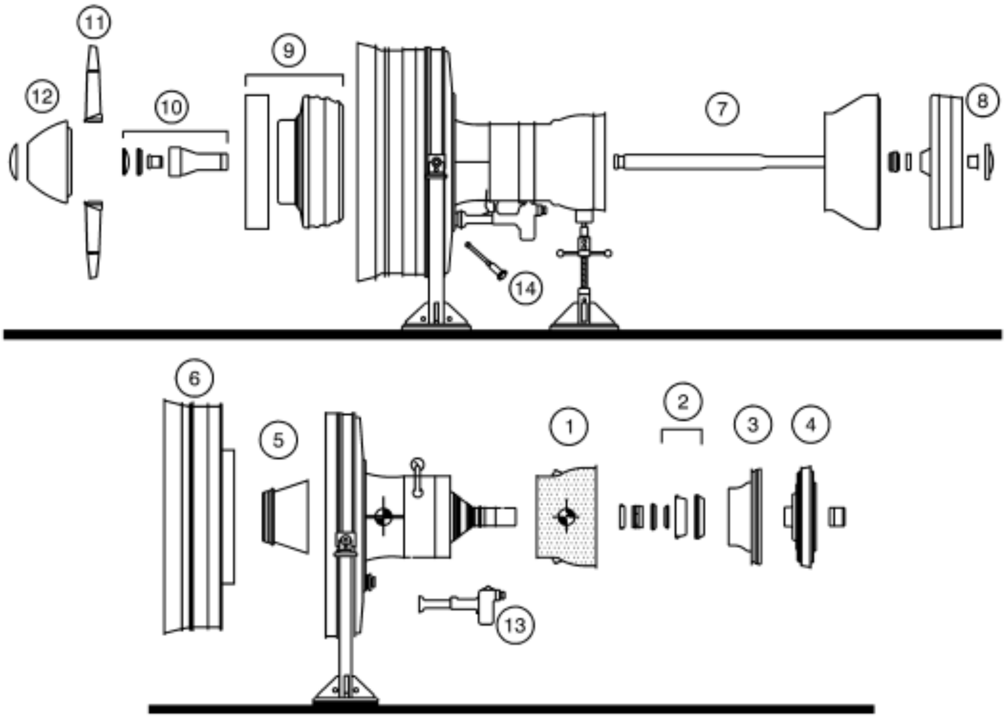
(11) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

(12) Install The Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(13) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(14) Install The Main Gearbox. Refer to 72-00-61, Installation-01 (Task 72-00-61-420-001).

(15) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Installation-03 (Task 72-00-34-450-001).



1. INSTALL DIFFUSER AND COMBUSTOR.
2. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
3. INSTALL TURBINE NOZZLE.
4. INSTALL HIGH PRESSURE TURBINE (HPT).
5. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
6. INSTALL FAN CASE.
7. INSTALL LOW PRESSURE TURBINE (LPT).
8. INSTALL TURBINE EXHAUST CASE.
9. INSTALL LOW PRESSURE COMPRESSOR (LPC).
10. INSTALL LPC/LPT COUPLING.
11. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
12. INSTALL COMPRESSOR INLET CONE.
13. INSTALL MAIN GEARBOX.
14. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-41-450-006:

1. Install Fuel Injector And Support

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85579	Adapter

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-007	Fluid, Leak Check (PMC 9569 Or PMC 2277)
	P05-059	Wax, Paraffin (PMC 9552)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
	P05-395	Beeswax
R	P05-396	Paraffin Wax Blend
	P06-035	Lubricating Fluid (PWA 36511)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
*Gasket	1	75-37-00/1/135
*Gasket	2	75-26-00/1/210
*Gasket	1	75-26-00/1/200
*Packing	1	79-22-00/3/1
Gasket	1	73-13-00/1/1
Packing	3	73-13-00/2/1
Packing	2	73-13-00/3/1

NOTE: NOTE: Parts marked with (*) are required only if parts are removed to gain access to specific fuel injectors. See text.

Quantities shown are for replacement of one fuel injector and assumes that the fuel nozzle supply manifold was

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM

(CONTINUED)
completely removed for access. Quantities for removing two or more fuel injectors are not proportional.

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) Remove protective closures.

(2) Install gasket, lubricated with Beeswax P05−395 or Paraffin Wax Blend P05−396, and fuel injector to boss on diffuser case. Rotate injector into position and tilt to engage burner.

(3) Install bracket (if applicable) to position marked at disassembly. See Figure 401 and Figure 402. Secure injector with bolts, threads lubricated with Engine Oil P03−001. Tighten bolts to a torque of 65 − 85 lb−in. (7.344 − 9.604 N.m) then without loosening, continue to tighten to same torque until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(4) (Reference 407) Install packing, lubricated with Lubricating Fluid P06−035 to packing groove on just installed fuel injector and two adjacent injectors.

(5) (Reference 2152) Install two packings, lubricated with Lubricating Fluid P06−035, to grooves in transfer tube.

(6) Install transfer tube into adapter on fuel supply manifold.

(7) Lubricate threads of injector adapters and adapter on fuel supply manifold with Engine Oil P03−001, and install fuel injector supply manifold to injectors and to fuel supply tube, securing tube nuts handtight. Loosen one half turn.

(8) Examine the applicable tube and manifold packings at connections as follows.

(a) Connect the PWA 85579 Adapter to the fuel distribution valve with the packing and bolts.

(b) Supply clean dry air through the adapter at 95 − 105 psig (655.0 − 723.9 kPa). Apply Leak Check Fluid P05−007 to connections and examine for leaks. Maintain pressure for a minimum of five minutes.

NOTE: Be sure all applicable manifold and tube connections are loose enough to find any leaks in the transfer tube packings. Check to be sure that air is flowing from all 24 nozzles. No leakage from any surface, joint or connection is permitted.

(c) If a leak is found, repair or replace the parts as necessary. Repeat this test.

(d) If no leak is found, remove the air source and the PWA 85579 Adapter.

(9) (Reference 2152) Torque tube nut to fuel supply manifold adapter (8 places) to 275 − 325 lb−in. (31.071 − 36.720 N.m).

(10) (Reference 2152) Torque manifold nuts on fuel injectors (24 places) to 185 − 200 lb−in. (20.902 − 22.597 N.m).

(11) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety all the tube and manifold nuts.

(12) If No. 3 bearing oil scavenge manifold (LR04) was removed for access to injector No. 13, comply with the following. See Figure 403.

(a) Remove protective closures and install packing lubricated with Engine Oil P03−001, to packing groove at flanged end of manifold.

(b) Lubricate threads on manifold elbow with Engine Oil P03−001, and install manifold to diffuser case internal tube nut at approximately 6 o'clock position, and to port on main oil pump with bolts,
R threads lubricated with Antiseize Paste P06−054,
R handtight only. Wipe off unwanted paste.

(c) (Pre SB PW4ENG 79-46) Secure manifold to oil pump bracket with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 403, (Sheet 1).

(d) (Post SB PW4ENG 79-46 and Pre SB PW4ENG 79-75) Secure the (LR04) manifold to the oil pump bracket with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Secure the (LR04) manifold to the (LR05) manifold with the loop clamp grommet halves, clamp, bolt threads lubricated with Engine Oil P03-001, and nut. See Figure 403, (Sheet 2). Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) (Post SB PW4ENG 79-75) Secure the (LR04) hose and manifold assembly with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to the bracket bolted to the fluid pressure dampener or (Post SB PW4ENG 79-86) adapter which is mounted on the top of the lubrication and scavenge oil pump. Also secure the (LR04) hose and manifold assembly with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to the bracket installed between fuel injector pads 12 and 13. See Figure 403. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque bolts securing manifold flange to main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(g) Torque diffuser case internal tube nut to 650 - 700 lb-in. (73.440 - 79.089 N.m), while holding manifold elbow from turning. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(13) If lower right turbine blade cooling air tube (AP37) was removed for access to injector No. 12, comply with the following. See Figure 404.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 404.

(a) Remove protective closures. Install gasket, with raised sealing surface visible, to elbow end of tube, aligning tube slot and four bolt holes. Secure in place with Paraffin Wax P05−059. Install ring gasket to elbow groove with Paraffin Wax P05−059. Install locks to engage diffuser case internal tube lip and secure in place with Paraffin Wax P05−059.

(b) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly. See Figure 404.

(c) (Pre SB PW4ENG 72−572 or SB PW4ENG 72−537 or Post SB PW4ENG 72−627) Install the gasket and metering plate in the four hole air shutoff valve flanged end of the tube. Install gasket to lower flanged opening of air shutoff valve and hold in place with Paraffin Wax P05−059.

(d) (Post PW4ENG 72−572 and Pre SB PW4ENG 72−627 or Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the gasket and ring spacer in the four hole air shutoff valve flanged end of the tube. Install gasket to lower flanged opening of air shutoff valve and hold in place with Paraffin Wax P05−059.

(e) Secure elbow end of tube (gaskets in place) and bracket to diffuser case pad at approximately 5 o'clock position with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(f) Secure opposite end of tube to air shutoff valve with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(g) Secure tube to three brackets on diffuser case with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Torque all bolts at each end of tube to 85 - 95 lb-in. (9.604 - 10.734 N.m), then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts at the diffuser case pad.

(i) Secure fuel injector supply manifold to bracket attached to tube flange at diffuser case with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(14) (Pre SB PW4ENG 72-567) If (left) diffuser seal air vent tube (AP22) was removed for access to injector No. 22, comply with the following. See Figure 405, (Sheets 1 through 4).

(a) Remove protective closures. Install gasket to groove in HPC rear case boss at approximately 10:30 o'clock position. Install deflector aligning pin with hole in HPC rear case boss.

R R (b) Lubricate tube nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Install gasket to flanged end of tube and secure in place with Paraffin Wa P05-059.

(c) Install tube to engine and connect tube nut to diffuser case intenal tube at approximately 11 o'clock position handtight only.

(d) Install bracket and bolts, threads lubricated with Engine Oil P03-001, to secure flanged end of tube to HPC rear case handtight only.

(e) Secure tube to bracket at No. 21 fuel injector with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Torque clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque tube nut to 825 - 900 lb-in. (93.212 - 101.686 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(g) Torque bolts securing tube flange and bracket to HPC rear case to 85 − 95 lb−in. (9.604 − 10.734 N.m) then retorque without loosening until same torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(h) Secure PT4.95 tube and air shutoff valve signal tube to bracket at flanged end of vent tube with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(15) (Post SB PW4ENG 72−567) If (left) diffuser seal air vent tube (AP22) was removed for access to injector No. 22, comply with the following. See Figure 405, (Sheets 5 through 8).

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove the protection covers. Install a gasket to the groove in the HPC rear case boss at approximately the 10:30 o'clock position.

(b) Install a gasket to the flanged end (with four holes) of the tube and attach the gasket in place with Paraffin Wax P05−059. Align the pin on the deflector with the hole in the HPC case boss.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 402.

(c) Install the locks to the diffuser case internal tube inside boss at approximately the 11 o'clock position. Attach the locks in place with Paraffin Wax P05−059.

R
R

(d) (Reference 2261) Hold the tube locks inward against the tube lip. Measure and make sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and make sure the internal tube lip is engaged properly.

(e) Install the four hole gasket with the raised portion outward toward the tube flange. Install the second gasket in groove of the same opening and attach both gaskets in place with Paraffin Wax P05−059.

(f) Install the tube to the engine (gaskets in place). Attach the tube to the diffuser case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(g) Attach the tube to the HPC rear case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(h) Install a clamp, bolt, threads lubricated with Engine Oil P03−001, and nut to attach the tube to the fuel injector bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Torque the bolts that attach the tube flange to the HPC rear case to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(j) Torque the bolts that attach the tube flange to the diffuser case and the four bolts that attach a bracket to the tube flange to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(k) Install a clamp to the No. 3 bearing breather tube assembly (LB03). Attach the clamp to the bracket from the diffuser pad at the 11 o'clock position with a bolt, threads lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) If turbine cooling tube (lower right) was removed for access to injector No. 7, install tube per 72−00−52, Installation−07 Task 72−00−53−450−004.

(2) If turbine cooling tube (upper left) was removed for access to injector No. 20, install tube per 72−00−52, Installation−07 Task 72−00−53−450−004.

(3) If oil tank was removed for access to injectors No. 16 and 17, install oil tank per 72−00−61, Installation−28 Task 72−00−61−450−012.

(4) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

(Task 72−00−41−450−006)

Task 72−00−41−450−008:

1. Install Fuel Injector And Support

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85579	Adapter

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−007	Fluid, Leak Check (PMC 9569 Or PMC 2277)
	P05−059	Wax, Paraffin (PMC 9552)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
	P05−395	Beeswax
R	P05−396	Paraffin Wax Blend
	P06−035	Lubricating Fluid (PWA 36511)
R	P06−054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
*Gasket	1	75−37−00/1/135
*Gasket	2	75−26−00/1/210
*Gasket	1	75−26−00/1/200
*Packing	1	79−22−00/3/1
Gasket	1	73−13−00/1/1
Packing	3	73−13−00/2/1
Packing	2	73−13−00/3/1

NOTE: NOTE: Parts marked with (*) are required only if parts are removed to gain access to specific fuel injectors. See text.

NOTE: Quantities shown are for replacement of one fuel injector and assumes that the fuel nozzle supply manifold was completely removed for access. Quantities for removing two or more fuel injectors are not proportional.

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) Remove protective closures.

(2) Install gasket, lubricated with Beeswax P05−395 or Paraffin Wax Blend P05−396, and fuel injector to boss on diffuser case. Rotate injector into position and tilt to engage burner.

(3) Install bracket (if applicable) to position marked at disassembly. See Figure 401 and Figure 402. Secure injector with bolts, threads lubricated with Engine Oil P03−001. Tighten bolts to a torque of 65 − 85 lb−in. (7.344 − 9.604 N.m) then without loosening, continue to tighten to same torque until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(4) (Reference 407) Install packing, lubricated with Lubricating Fluid P06−035 to packing groove on just installed fuel injector and two adjacent injectors.

(5) (Reference 2152) Install two packings, lubricated with Lubricating Fluid P06−035, to grooves in transfer tube.

(6) Install transfer tube into adapter on fuel supply manifold.

(7) Lubricate threads of injector adapters and adapter on fuel supply manifold with Engine Oil P03−001, and install fuel injector supply manifold to injectors and to fuel supply tube, securing tube nuts handtight. Loosen one half turn.

(8) Examine the applicable tube and manifold packings at connections as follows.

  (a) Connect the PWA 85579 Adapter to the fuel distribution valve with the packing and bolts.

  (b) Supply clean dry air through the adapter at 95 − 105 psig (655.0 − 723.9 kPa). Apply Leak Check Fluid P05−007 to connections and examine for leaks. Maintain pressure for a minimum of five minutes.

NOTE: Be sure all applicable manifold and tube connections are loose enough to find any leaks in the transfer tube packings. Check to be sure that air is flowing from all 24 nozzles. No leakage from any surface, joint or connection is permitted.

(c) If a leak is found, repair or replace the parts as necessary. Repeat this test.

(d) If no leak is found, remove the air source and the PWA 85579 Adapter.

(9) (Reference 2152) Torque tube nut to fuel supply manifold adapter (8 places) to 275 − 325 lb−in. (31.071 − 36.720 N.m).

(10) (Reference 2152) Torque manifold nuts on fuel injectors (24 places) to 185 − 200 lb−in. (20.902 − 22.597 N.m).

(11) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to all the tube and manifold nuts.

(12) If No. 3 bearing oil scavenge manifold (LR04) was removed for access to injector No. 13, comply with the following. See Figure 403.

(a) Remove protective closures and install packing lubricated with Engine Oil P03−001, to packing groove at flanged end of manifold.

(b) Lubricate threads on manifold elbow with Engine Oil P03−001, and install manifold to diffuser case internal tube nut at approximately 6 o'clock position, and to port on main oil pump with bolts,
R threads lubricated with Antiseize Paste P06−054,
R handtight only. Wipe off unwanted paste.

(c) (Pre SB PW4ENG 79−46) Secure manifold to oil pump bracket with clamp, bolt, threads lubricated with Engine Oil P03−001, and nut. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Figure 403 (Sheet 1).

(d) (Post SB PW4ENG 79-46 and Pre SB PW4ENG 79-75) Secure the (LR04) manifold to the oil pump bracket with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut. Secure the (LR04) manifold to the (LR05) manifold with the loop clamp grommet halves, clamp, bolt threads lubricated with Engine Oil P03-001, and nut. See Figure 403 (Sheet 2). Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) (Post SB PW4ENG 79-75) Secure the (LR04) hose and manifold assembly with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to the bracket bolted to the fluid pressure dampener or (Post SB PW4ENG 79-86) adapter which is mounted on the top of the lubrication and scavenge oil pump. Also secure the (LR04) hose and manifold assembly with clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to the bracket installed between fuel injector pads 12 and 13. See Figure 403. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque bolts securing manifold flange to main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(g) Torque diffuser case internal tube nut to 650 - 700 lb-in. (73.440 - 79.089 N.m), while holding manifold elbow from turning and secure with the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the nut.

(13) If lower right turbine blade cooling air tube (AP37) was removed for access to injector No. 12, comply with the following. See Figure 404.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 404.

(a) Remove protective closures. Install gasket, with raised sealing surface visible, to elbow end of tube, aligning tube slot and four bolt holes. Secure in place with Paraffin Wax P05-059. Install ring gasket to elbow groove with Paraffin Wax P05-059. Install locks to engage diffuser case internal tube lip and secure in place with Paraffin Wax P05-059.

(b) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly. See Figure 404.

(c) (Pre SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Install the gasket and metering plate in the four hole air shutoff valve flanged end of the tube and hold in place with Paraffin Wax P05-059. Install gasket to lower flanged opening of air shutoff valve and hold in place with Paraffin Wax P05-059.

(d) (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Install the gasket and ring spacer in the four hole flanged end of the tube and hold in place with Paraffin Wax P05-059. Install gasket to lower flanged opening of air shutoff valve and hold in place with Paraffin Wax P05-059.

(e) Secure elbow end of tube (gaskets in place) and bracket to diffuser case pad at approximately 5 o'clock position with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(f) (Pre SB PW4ENG 72-537 and Post SB PW4ENG 72-627) Secure opposite end of tube (gasket and metering plate in place) to air shutoff valve with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(g) (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Secure opposite end of tube (gasket and ring spacer in place) to air shutoff valve with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(h) Secure tube to three brackets on diffuser case with clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque all bolts at each end of tube to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at the diffuser case pad.

(j) Secure fuel injector supply manifold to bracket attached to tube flange at diffuser case with clamp, bolt, threads lubricated with Engine Oil P03−001, and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) If the (left) diffuser seal air vent tube (AP22) was removed for access to injector No. 22, do the steps that follow. See Figure 405 (Sheets 1 through 4).

NOTE: Make sure to remove the temporary safety wire that is around the internal diffuser seal air vent tube assembly before you install the locks. Be careful not to let the tube drop into the diffuser case after you remove the temporary safety wire.

(a) Remove the protection covers. Install a gasket to the groove in the HPC rear case boss at approximately 10:30 o'clock position.

(b) Install a gasket to the flanged end (with four holes) of the tube and attach the gasket in place with Paraffin Wax P05−059. Align the pin on the deflector with the hole in the HPC case as you install the deflector into the HPC rear case boss.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 405.

(c) Install the locks to the diffuser case internal tube inside boss at approximately the 11 o'clock position. Attach the locks in place with Paraffin Wax P05−059.

(d) (Reference 2261) Hold the tube locks inward against the tube lip. Measure and make sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and make sure the internal tube lip is engaged properly.

(e) Install the four hole gasket with the raised portion outward toward the tube flange. Install the second gasket in groove of the same opening and attach both gaskets in place with Paraffin Wax P05−059.

(f) Install the tube to the engine (gaskets in place). Attach the tube to the diffuser case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(g) Attach the tube to the HPC rear case with a bracket and bolts, threads lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(h) Install a clamp, bolt, threads lubricated with Engine Oil P03−001, and nut to attach the tube to the fuel injector bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Torque the bolts that attach the tube flange to the HPC rear case to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(j) Torque the bolts that attach the tube flange to the diffuser case and the four bolts that attach a bracket to the tube flange to 85 − 95 lb−in. (9.604 − 10.734 N.m). Without loosening the bolts, torque again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(k) Install a clamp to the No. 3 bearing breather tube assembly (LB03). Attach the clamp to the bracket from the diffuser pad at the 11 o'clock position with a bolt, threads lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) If turbine cooling tube (lower right) was removed for access to injector No. 7, install tube by 72−00−52, Installation−07 Task 72−00−53−450−004.

(2) If turbine cooling tube (upper left) was removed for access to injector No. 20, install tube by 72−00−52, Installation−07 Task 72−00−53−450−004.

(3) If oil tank was removed for access to injectors No. 16 and 17, install oil tank by 72−00−61, Installation−28 Task 72−00−61−450−012.

(4) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72−00−41−450−007:

1. Install Igniter Plug And Igniter Plug Boss

A. General

(1) This procedure applies to both igniter plug locations. If boss or spacer(s) are to be replaced, and parts removed at disassembly are not available, igniter plug immersion depth must be determined using this procedure. If none of the above parts are to be replaced, install igniter plug per Installation−07 Task 72−00−41−450−004.

(2) If boss or spacer(s) are to be replaced, and parts removed at disassembly are available, check boss and spacer thickness per Installation−08 Task 72−00−41−450−005.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 24524	Tap−Chasing
PWA 27641	Tap−Chasing
PWA 75509	Gage, Immersion

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−005	Cloth, Cotton Lint−Free
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
R P06−009	Compound, Antiseize (PMC 9523)
P06−023	Lubricant, Silver Goop (PWA 36001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	74−21−00/2/20
Grommet	1	PN 10−700305

C. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) If necessary, clean threads of boss (402/2, 403/2, 404/2) using PWA 24524 Tap.

(2) Install new key washer (402/4, 403/4, 404/4) to igniter boss (402/2, 403/2, 404/2) with tabs toward boss.

(3) Install boss and key washer to igniter plug (402/3, 403/3, 404/3) fingertight.

(4) (Reference 365) Measure Dimension A from plug tip to bottom face of boss. See Figure 402, Figure 403, and Figure 404. Record Dimension A.

(5) Disassemble key washer and boss from igniter plug and place on bench.

(6) Using a strong light, look in igniter boss hole in diffuser case and determine which igniter plug guide configuration (shielded or unshielded) is installed in outer combustion chamber. See Figure 402, Figure 403, and Figure 404.

NOTE: Presently, there are two igniter plug guide configurations installed in outer combustion chambers. Prior configuration chambers incorporate extended sleeve (402/6) and no shield. Later configuration chambers incorporate a flush sleeve and a shield (403/6) or a flush sleeve and a lock (404/6).

(7) Measure igniter plug immersion depth using PWA 75509 Immersion Gage (402/5, 403/5, 404/5).

(a) Using detail gage master (402/7, 403/7, 404/7), place master between gage hook and gage base. Set gage indicator level to zero.

(b) Insert gage into the igniter boss hole in diffuser case until gage base is seated on face of case boss.

(c) Rotate gage base to obtain an uninterrupted view of dial gage face.

(d) Holding gage base, rotate probe until notch in probe disk is pointing to rear of engine.

(e) Depress probe and slide gage towards rear of engine to seat gage hook against rear ID surface of outer combustion chamber (402/8, 403/8). See Figure 402, Figure 403, and/or Figure 404.

(f) Release probe and record dial gage reading. Add the gage reading to 2.200 inches (55.880 mm) if reading is a plus reading. Subtract the gage reading from 2.200 inches (55.880 mm) if reading is a minus reading. Result is Dimension B.

(g) (Pre SB PW4ENG 72−152) For engines incorporating combustion chambers with extended sleeve (402/6) and no shield, add 0.025 inch (0.635 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

(h) Select a classified spacer (402/1) or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacer(s) not to exceed 0.300 inch (7.620 mm). See Figure 402 and Figure 405.

(i) (Post SB PW4ENG 72−152 and Post SB PW4ENG 72−601) For engines incorporating combustion chambers with flush sleeve and a shield (403/6), add 0.125 inch (3.175 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

(j) Select a classified spacer (403/1) or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacers(s) not to exceed 0.300 inch (7.620 mm). See Figure 403 and Figure 405.

(k) For engines with Talon Low Emission combustion chambers there is a flush sleeve and a lock (404/6). Add 0.075 inch (1.905 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

(l) Select a classified spacer (404/1) or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacer(s) not to exceed 0.300 inch (7.620 mm). See Figure 404 and Figure 405.

(8) If necessary, clean threads in diffuser case port using PWA 27641 Tap.

(9) Install key washer (401/3) to igniter boss (401/2) and bend tabs over to secure.

(10) Lubricate OD threads of boss with Engine Oil P03-001.

(11) (Reference 400) Install previously selected classified spacer(s) to boss and install boss to diffuser case. Torque boss to 600 - 700 lb-in. (67.791 - 79.089 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the boss.

(12) Apply Thread Lubricant P06-023 to threads of igniter plug.

(13) (Reference 401) Install igniter plug to boss. Torque plug to 300 - 360 lb-in. (33.895 - 40.675 N.m).

NOTE: Keep igniter plug boss from turning while torquing plug.

(14) Remove protective closure from end of igniter plug cable.

(15) Check cable contact for evidence of arcing (discoloration and heavy pitting). Check cable end for evidence of carbon tracking. Replace the cable if either condition is found. See 72-00-41, Removal-04 Task 72-00-41-050-001 or Removal-05 Task 72-00-41-050-002 and Installation-04 Task 72-00-41-450-001 or Installation-05 Task 72-00-41-450-002.

(16) Install new grommet on cable as follows:

(a) Clean new grommet with clean, Lint-Free Cotton Cloth P05-005, and the SPOP 208 Wipe Method. See Standard Practices Manual, PN 585005.

(b) Slide grommet on cable.

(c) Apply Antiseize Compound P06−009, to threads of cable nut.

(17) Connect cable to igniter plug. Torque cable nut to 140 − 160 lb−in. (15.818 − 18.078 N.m).

NOTE: Insufficient torque on cable nuts can cause ignition radiated noise to be picked up by aircraft radio equipment.

(18) (Reference 2151) Install heat shields (401/5, 401/6) at igniter plug (401/4). Bend tabs of igniter plug heat shields into groove in boss (401/2) before securing clamp (401/7). Secure with clamp. Torque clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

D. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Spacer Classification Data

Igniter Boss Classified Spacer
Figure 405
(Task 72-00-41-450-007)

Task 72-00-41-420-013:

1. Install Diffuser And Combustor (Vertical) Without No. 3 Bearing Outer Race Previously Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-01 Task 72-00-41-420-001for alternate procedure with No. 3 bearing outer race installed. Outer race was previously installed into diffuser combustor group before being installed onto HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

(2) Assemble diffuser and combustor by means of 72-41-00, Assembly-01 Task 72-41-00-400-001.

B. Equipment And Materials Required

Standard Tools:

0.250-28 Jackscrews (Four Required)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29754	Control (Or Equivalent)
PWA 76154	Adapter (Two Required)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Required)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Bracket (Two Required)
PWA 85795	Heater

Special Tools:

(CONTINUED)

PWA 85797	Wrench (Optional To PWA 86491)
PWA 85798	Drift (Optional To PWA 87433)
PWA 85901	Riveter
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

	Item No.	Designation
	P03-001	Engine Oil (PWA 521B)
	P05-026	Ink (Marking) (PMC 4057-1)
	P05-059	Wax, Paraffin (PMC 9552)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-00-41/1/1
Rivet	1	72-41-00/12/40

C. Procedure
See Figure 402 and Figure 403.

(1) Remove PWA 85159 Thread Protector (403/7) and PWA 85428 Knife-Edge Protector (403/6) from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(2) Visually inspect HPC rear drum OD thrust balance knife-edge per 72-00-35, Inspection/Check-04 (visual only) Task 72-00-35-210-004. Reject the airseal with cracks confirmed by visual inspection.

(3) Place No. 3 bearing assembly on clean waxed paper on bench.

(4) Separate outer race (402/6) from inner race and rollers (402/1) and place them, serial number up, on bench.

(5) Verify bearing inner and outer race part numbers are the same.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(6) Measure thickness of No. 3 bearing front seal seat (402/3) across thinner ID section of seal seat. Measure No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/1) thickness. Record this total thickness as Dimension A.

(7) Measure distance from end of HPC rear hub (402/4) down to seal seat shoulder (402/5) on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(8) Measure thickness of No. 3 bearing outer race (402/6) thickness. Record this dimension as Dimension D.

(9) Measure distance from top of No. 3 bearing support to outer race seating shoulder. Record this dimension as Dimension E.

NOTE: Dimensions D and E will be used to perform a seating check later during this installation procedure.

(10) Locate two dimples on top surface of No. 3 bearing housing (402/7) threaded ID. Mark a line between the dimples with Ink P05-026.

(11) For engines with gasket groove on rear flange of HPC rear case (Post SB PW4ENG 72-48), install gasket to flange groove and secure in place with Paraffin Wax P05-059. See Figure 403.

NOTE: Engines prior to (SB PW4ENG 72-48) do not accept gasket at Flange K.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−15

(12) Install two PWA 85751 Handling Brackets to diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

(13) For PWA 85701 Guide, retract two setscrews on side of guide. Position PWA 85701 Guide or PWA 85308 Guide larger diameter end first on HPC rear hub and seat on seal seat shoulder. For PWA 85701 Guide, handtighten two setscrews on side of guide.

(14) Install three PWA 85310 Alignment Pins into rear flange of HPC case.

(a) Remove screws from storage locations in plate details of alignment pins.

(b) Locate three equally spaced 0.250−28 jackscrew holes in rear flange of HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through unthreaded holes in rear flange of HPC case. Secure pins with detail screws.

(15) With hoist, connect PWA 28657 Sling with two PWA 76154 Adapters to outer trunnion spools of PWA 85045 Brackets on diffuser case.

(16) With hoist position diffuser and combustor assembly over HPC rear hub. Align pins in HPC rear case with mating holes in diffuser case. With workbolts and nuts, seat diffuser case on HPC rear case.

(17) Remove work bolts, nuts, and PWA 85310 Pins. For PWA 85701 Guide, retract two setscrews on side of guide. Remove PWA 85701 Guide or PWA 85308 Guide from HPC rear hub.

(18) Remove PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(19) Install the Flange K hardware as follows: Refer to 72−00−41, Installation−20 (Task 72−00−41−420−020).

(20) Assemble PWA 85067 Fixture (404/3) to No. 3 bearing front seal seat (404/4). See Figure 404.

(21) Install fixture with seal seat polished face down over HPC rear hub and drift to seat if necessary. Remove fixture.

(22) Assemble PWA 85068 Fixture (404/1) to No. 3 bearing seal spacer (404/2).

(23) Install fixture with seal spacer over HPC rear hub and drift to seat if necessary. Remove fixture.

(24) Heat the No. 3 bearing inner race and rollers.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN INSULATED GLOVES TO PREVENT BEARING DAMAGE.

(25) Remove the heated inner race and rollers from the heat source.

(26) Install the heated No. 3 bearing inner race and rollers (405/2) onto HPC rear hub, puller grooves up. Seat bearing with PWA 85070 Drift (405/1) and keep constant downward pressure on bearing for approximately three minutes to make sure of correct seating. After seating remove drift. See Figure 405.

(27) After inner race has reached room temperature measure distance from end of HPC rear hub down to rear of inner race and rollers with depth gage. Record this distance as Dimension C. See Figure 402.

(28) Dimension C must not be less than previously taken Dimension B minus Dimension A.

NOTE: If Dimension C is less than required it indicates bearing is not fully seated.

(29) Remove PWA 85168 Protector (405/3) from diffuser case. See Figure 405.

(30) Heat No. 3 bearing housing. See Figure 406.

NOTE: If PWA 85679 Heater is used a heat shield must be made locally to protect the No. 3 bearing inner race and rollers.

(a) Install PWA 85795 Heater or PWA 85679 Heater (406/5) to rear flange of housing. Connect power and thermocouple cables to PWA 29754 Control (406/3) or equivalent control.

(b) Set heater to 300°F (149°C) and heat housing for 55 − 60 minutes.

(31) After No. 3 bearing housing is correctly heated turn off heater. Disconnect control and remove heater from housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(32) (Reference 1006) Install No. 3 bearing outer race (406/6) into bearing housing with serial number up and align "X" mark on outer race with ink mark between the two dimples on top of housing.

CAUTION: DO NOT HIT BEARING ROLLERS WITH THE DRIFT WHEN SEATING OUTER RACE.

(33) Position PWA 87433 Drift or PWA 85798 Drift (406/2) on outer race and seat race. Make sure outer race is seated against shoulder in housing. Remove the drift.

(34) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure bearing outer race is correctly seated. See Figure 402.

(a) Measure Distance F from top of No. 3 bearing housing to top of bearing outer race (402/7).

(b) Dimension F must not be less than previously taken Dimension E minus Dimension D.

NOTE: If Dimension F is less than required, it indicates outer race is not fully seated.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR.

CAUTION: NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED, NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO AVOID INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READING, NO. 3 BEARING AND HOUSING MUST BE AT ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

(35) Lubricate the No. 3 bearing outer race retaining nut (406/8) with Engine Oil P03−001.

(36) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(37) Install PWA 85168 Protector (406/4) to diffuser case.

(38) Install retaining nut into housing with slots up, handtighten.

(39) Slide PWA 86491 Driver or PWA 85797 Wrench (406/10) over HPC rear hub, locating the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(40) Mechanical Wrench Method (Optional) − See Figure 406, Sheet 2.

(a) Install PWA 102743 Torque Adapter (406/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (406/12) over PWA 102743 Torque Adapter (406/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (406/13) to engage both PWA 102743 Torque Adapter (406/11) and PWA 102744 Holder Adapter (406/12).

(41) (Reference 975) Torque retaining nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(42) Remove wrench/driver from the No. 3 bearing retaining nut.

(43) Remove the six workbolts from bearing housing.

(44) Install rivet (406/7) into aligned holes in the retaining nut and housing using PWA 85901 Riveter and flare rivet to secure.

(45) Install PWA 85159 Thread Protector (406/1) over HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To The Complete Installation Of The Diffuser Combustor. Refer to 72−00−41, Installation−02 (Task 72−00−41−420−002).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From The Front End Down To The Horizontal Position. Refer to 72−00−00, Special Procedures−10 (Task 72−00−00−420−002−A00).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72−00−41, Installation−03 (Task 72−00−41−420−003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72−00−41, Inspection/Check−07 (Task 72−00−41−720−001).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(8) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(10) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(11) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(12) Install The LPC/LPT Coupling (With the Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

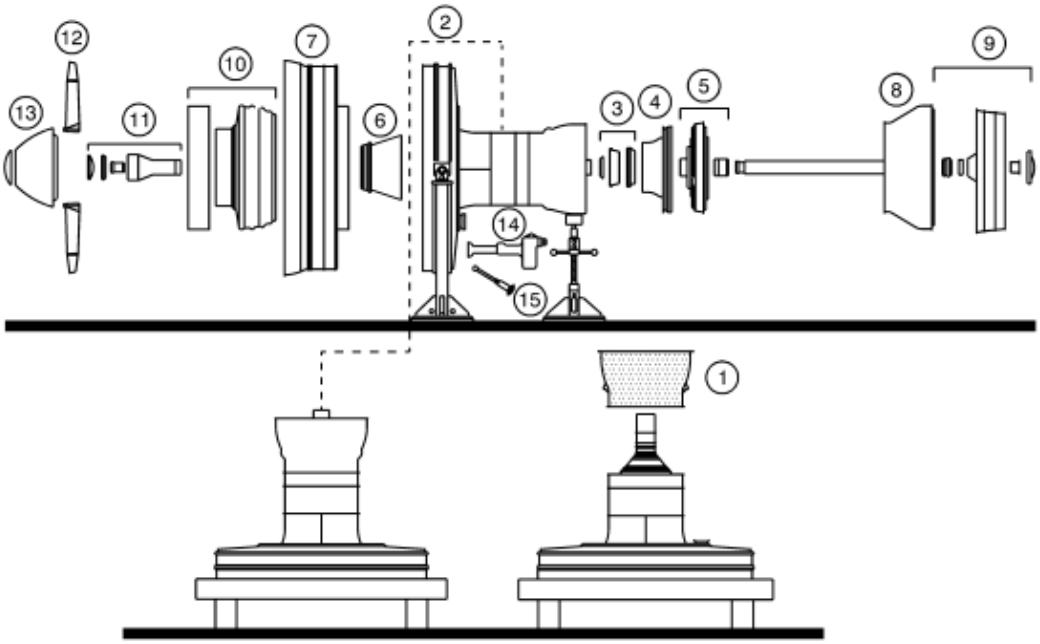
(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72-00-31, Installation-04 (Task 72-00-31-420-002-002).

(14) Install The Compressor Inlet Cone. Refer to 72-00-31, Installation-02 (Task 72-00-31-420-001).

(15) Install The Main Gearbox. Refer to 72-00-61, Installation-01 (Task 72-00-61-420-001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72-00-34, Installation-03 (Task 72-00-34-450-001).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−15



1. INSTALL DIFFUSER AND COMBUSTOR.
2. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO HORIZONTAL.
3. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
4. INSTALL TURBINE NOZZLE.
5. INSTALL HIGH PRESSURE TURBINE (HPT).
6. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
7. INSTALL FAN CASE.
8. INSTALL LOW PRESSURE TURBINE (LPT).
9. INSTALL TURBINE EXHAUST CASE.
10. INSTALL LOW PRESSURE COMPRESSOR (LPC).
11. INSTALL LPC/LPT COUPLING.
12. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
13. INSTALL COMPRESSOR INLET CONE.
14. INSTALL MAIN GEARBOX.
15. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-41-420-017:

1. Install Diffuser And Combustor (Vertical) Without No. 3 Bearing Outer Race Previously Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-01 Task 72-00-41-420-006 for optional procedure with the No. 3 bearing outer race installed. The outer race was installed into the diffuser combustor group before installation onto the HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures show where necessary in the text that follows and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

(2) Assemble diffuser and combustor by 72-41-00, Assembly-01 Task 72-41-00-400-001-A00.

B. Equipment And Materials Required

Standard Tools:

0.250-28 Jackscrews (Four Necessary)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29754	Control (Or Equivalent)
PWA 76154	Adapter (Two Necessary)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Necessary)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Bracket (Two Necessary)

Special Tools:

(CONTINUED)

PWA 85795	Heater
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85798	Drift (Optional To PWA 87433)
PWA 85901	Riveter
PWA 85983	Adapter, Stabilizer (Two Necessary Twin Overhead Rail System Only)
PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P05-026	Ink (Marking) (PMC 4057-1)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
R P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-00-41/1/1
Rivet	1	72-41-00/12/40

C. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, and Figure 406.

(1) Remove the PWA 85159 Thread Protector (403/7) and PWA 85428 Knife-Edge Protector (403/6) from the HPC rear hub.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(2) Make a visual inspection of the HPC rear drum OD thrust balance knife-edge by 72-00-35, Inspection/Check-04 (visual only) Task 72-00-35-210-004 . Reject the airseal with cracks found by visual inspection.

(3) Put the No. 3 bearing assembly on clean waxed paper on the bench.

(4) Remove the outer race (402/6) from the inner race and rollers (402/1) and put them, serial number up, on the bench.

(5) Make sure the bearing inner and outer race part numbers are the same.

CAUTION: THE THICKNESS OF THE NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THE THINNER, ID, SECTION OF THE SEAL SEAT OR INCORRECT DIMENSIONS WILL RESULT.

(6) Measure the thickness of the No. 3 bearing front seal seat (402/3) across the thinner ID section of the seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness and the No. 3 bearing inner race and rollers (402/1) thickness. Make a record of this total thickness as Dimension A.

(7) Measure the distance from the end of the HPC rear hub (402/4) down to the seal seat shoulder (402/5) on the hub. Make a record of this dimension as Dimension B.

NOTE: Dimensions A and B are used to do a seating check later during this installation procedure.

(8) Measure the thickness of the No. 3 bearing outer race (402/6) thickness. Make a record of this dimension as Dimension D.

(9) Measure distance from the top of the No. 3 bearing support to the outer race seating shoulder. Make a record of this dimension as Dimension E.

NOTE: Dimensions D and E are used to do a seating check later during this installation procedure.

(10) Find the two dimples on the top surface of the No. 3 bearing housing (402/7) threaded ID. Make a mark between the dimples with Ink P05−026.

(11) Install a gasket to the flange groove and attach in position with Paraffin Wax P05−059. See Figure 403.

(12) Install two PWA 85751 Handling Brackets to the diffuser case.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations, install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of the diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket in the rear most two holes as marked on the bracket.

(13) For PWA 85701 Guide, retract the two setscrews on the side of the guide. Install the PWA 85701 Guide or PWA 85308 Guide larger diameter end first on the HPC rear hub and seat on the seal seat shoulder. For PWA 85701 Guide, handtighten two setscrews on the side of the guide.

(14) Install three PWA 85310 Alignment Pins into the rear flange of the HPC case.

(a) Remove the screws from the storage locations in the plate details of the alignment pins.

(b) Find the three equally spaced 0.250−28 jackscrew holes in the rear flange of the HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through the unthreaded holes in the rear flange of the HPC case. Attach the pins with detail screws.

(15) With a hoist, connect the PWA 28657 Sling with two PWA 76154 Adapters to the outer trunnion spools of the PWA 85045 Brackets on the diffuser case.

(16) With a hoist install the diffuser and combustor assembly over the HPC rear hub. Align the pins in the HPC rear case with the mating holes in the diffuser case. With workbolts and nuts, seat the diffuser case on the HPC rear case.

(17) Remove the work bolts, nuts, and PWA 85310 Pins. For PWA 85701 Guide, retract the two setscrews on the side of the guide. Remove the PWA 85701 Guide or PWA 85308 Guide from the HPC rear hub.

(18) Remove the PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(19) Install the Flange K hardware as follows. Refer to 72−00−41, Installation−20 (Task 72−00−41−020−020).

(20) Install the PWA 85067 Fixture (404/3) to the No. 3 bearing front seal seat (404/4). See Figure 404.

(21) Install the fixture with the seal seat polished face down over the HPC rear hub and drift to seat if necessary. Remove the fixture.

(22) Install the PWA 85068 Fixture (404/1) to the No. 3 bearing seal spacer (404/2).

(23) Install the fixture with the seal spacer over the HPC rear hub and drift to seat if necessary. Remove fixture.

(24) Heat the No. 3 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

CAUTION: WEAR CLEAN INSULATED GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(25) Remove the heated inner race and rollers from the heat source.

(26) Install the heated No. 3 bearing inner race and rollers (405/2) onto the HPC rear hub, puller grooves up. Seat the bearing with PWA 85070 Drift (405/1) and keep constant downward pressure on the bearing for approximately three minutes to make sure of correct seating. After seating remove the drift. See Figure 405.

(27) After the inner race has reached room temperature measure the distance from the end of the HPC rear hub down to the rear of the inner race and rollers with a depth gage. Make a record of this distance as Dimension C. See Figure 402.

(28) Dimension C must not be less than Dimension B minus Dimension A.

NOTE: An indication that the bearing is not fully seated is when Dimension C is less than necessary.

(29) Remove the PWA 85168 Protector (405/3) from the diffuser case. See Figure 405.

(30) Heat the No. 3 bearing housing. See Figure 406.

NOTE: If PWA 85679 Heater is used, you must make a heatshield to protect the No. 3 bearing inner race and rollers.

(a) Install PWA 85795 Heater or PWA 85679 Heater (406/5) to the rear flange of the housing. Connect power and thermocouple cables to the PWA 29754 Control (406/3) or equivalent control.

(b) Set the heater to 300°F (149°C) and heat the housing for 55 − 60 minutes.

(31) After the No. 3 bearing housing is correctly heated turn off the heater. Disconnect the control and remove the heater from the housing.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO 3 BEARING OUTER RACE TO PREVENT BEARING DAMAGE.

(32) (Reference 1006) Install the No. 3 bearing outer race (406/6) into the bearing housing with the serial number up and align the "X" mark on the outer race with the ink mark between the two dimples on the top of housing.

CAUTION: DO NOT HIT THE BEARING ROLLERS WITH THE DRIFT WHEN YOU SEAT THE OUTER RACE.

(33) Install the PWA 87433 Drift or PWA 85798 Drift (406/2) on the outer race and seat the race. Make sure the outer race is seated against the shoulder in the housing. Remove the drift.

(34) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure the bearing outer race is correctly seated. See Figure 402.

(a) Measure the Distance F from the top of the No. 3 bearing housing to the top of the bearing outer race (402/7).

(b) Dimension F must not be less than Dimension E minus Dimension D.

NOTE: An indication that the outer race is not fully seated is when Dimension F is less than necessary.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS CAN OCCUR.

CAUTION: THE NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER YOU TORQUE THE NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION BEFORE THE ENGINE IS OPERATED, THE NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO PREVENT INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READINGS, THE NO. 3 BEARING AND HOUSING MUST BE AT ROOM TEMPERATURE. SHOP AIR CAN BE USED FOR COOLING. DO NOT USE DRY ICE.

(35) Lubricate the No. 3 bearing outer race retaining nut (406/8) with Engine Oil P03−001.

(36) Install six workbolts, lubricated with Engine Oil P03−001, into the bearing housing channel nuts equally around the housing. Torque the workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(37) Install the PWA 85168 Protector (406/4) to the diffuser case.

(38) Install retaining nut into housing with slots up, handtighten.

(39) Slide PWA 86491 Driver or PWA 85797 Wrench (406/10) over the HPC rear hub, install the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(40) Mechanical Wrench Method (Optional) − See Figure 406, Sheet 2.

(a) Install PWA 102743 Torque Adapter (406/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (406/12) over PWA 102743 Torque Adapter (406/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (406/13) to engage both PWA 102743 Torque Adapter (406/11) and PWA 102744 Holder Adapter (406/12).

(41) (Reference 975) Torque retaining nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(42) Remove the wrench/driver from the No. 3 bearing retaining nut.

(43) Remove the six workbolts from the bearing housing.

(44) Install the rivet (406/7) to the aligned holes in the retaining nut and housing. Use the PWA 85901 Riveter and flare the rivet to attach.

(45) Install the PWA 85159 Thread Protector (406/1) over the HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To The Complete Installation Of The Diffuser Combustor. Refer to 72-00-41, Installation-02 (Task 72-00-41-420-005).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From The Front End Down To The Horizontal Position. Refer to 72-00-00, Special Procedures-10 (Task 72-00-00-420-002-A).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(8) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(10) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001).

(11) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(12) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

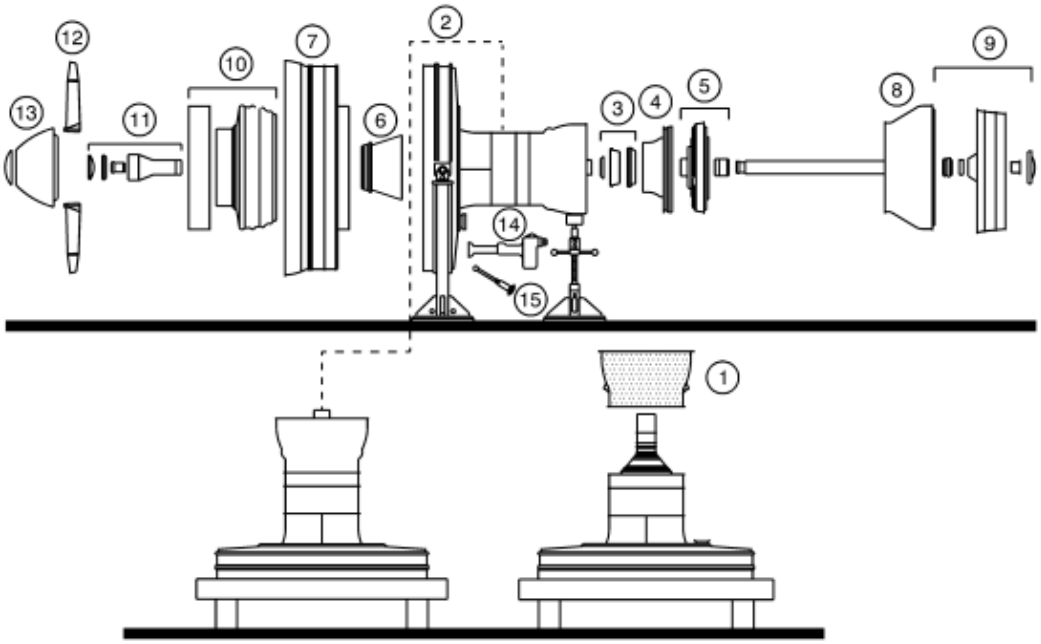
ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−15

(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72−00−31−420−002−002).

(14) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(15) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).



1. INSTALL DIFFUSER AND COMBUSTOR.
2. TRUNNION INTERMEDIATE THROUGH DIFFUSER CASE TO HORIZONTAL.
3. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
4. INSTALL TURBINE NOZZLE.
5. INSTALL HIGH PRESSURE TURBINE (HPT).
6. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
7. INSTALL FAN CASE.
8. INSTALL LOW PRESSURE TURBINE (LPT).
9. INSTALL TURBINE EXHAUST CASE.
10. INSTALL LOW PRESSURE COMPRESSOR (LPC).
11. INSTALL LPC/LPT COUPLING.
12. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
13. INSTALL COMPRESSOR INLET CONE.
14. INSTALL MAIN GEARBOX.
15. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-41-420-018:

1. Install Diffuser And Combustor (Horizontal) Without No. 3 Bearing Outer Race Previously Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72-00-41, Installation-12 Task 72-00-41-420-012 for alternate procedure with No. 3 bearing outer race installed. Outer race was previously installed into diffuser combustor group prior to being installed onto HPC.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

(2) Assemble diffuser and combustor by means of 72-41-00, Assembly-01 Task 72-41-00-400-001.

B. Equipment And Materials Required

Standard Tools:

0.250-28 Jackscrews (Four Required)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29754	Control (Or Equivalent)
PWA 76154	Adapter (Two Required)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Required)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Bracket (Two Required)

Special Tools:

(CONTINUED)

PWA 85795	Heater
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85798	Drift (Optional To PWA 87433)
PWA 85799	Pins, Guide And Support
PWA 85893	Support
PWA 85901	Riveter
PWA 85909	Adapter
PWA 85910	Adapter
PWA 85983	Adapter, Stabilizer (Two Required Twin Overhead Rail System Only)
PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

	Item No.	Designation
	P03−001	Engine Oil (PWA 521B)
	P05−026	Ink (Marking) (PMC 4057−1)
	P05−059	Wax, Paraffin (PMC 9552)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
R	P05−292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−41/1/1
Rivet	1	72−41−00/12/40

C. Procedure
See Figure 402 and Figure 403.

(1) Remove PWA 85159 Thread Protector and PWA 85428 Knife−Edge Protector from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(2) Visually inspect HPC rear drum OD thrust balance knife-edge per 72-00-35, Inspection/Check-04 (visual only) Task 72-00-35-210-004. Reject the airseal with cracks confirmed by visual inspection.

(3) Place No. 3 bearing assembly on clean waxed paper on bench.

(4) Separate outer race (402/7) from inner race and rollers (402/3) and place them, serial number up, on bench.

(5) Verify bearing inner and outer race part numbers are the same.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(6) Measure thickness of No. 3 bearing front seal seat (402/1) across thinner ID section of seal seat. Measure No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/3) thickness. Record this total thickness as Dimension A.

(7) Measure distance from end of HPC rear hub (402/4) down to seal seat shoulder (402/5) on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(8) Measure thickness of No. 3 bearing outer race (402/7) thickness. Record this dimension as Dimension D.

(9) Measure distance from top of No. 3 bearing support to outer race seating shoulder. Record this dimension as Dimension E.

NOTE: Dimensions D and E will be used to perform a seating check later during this installation procedure.

(10) Locate two dimples on top surface of No. 3 bearing housing (402/6) threaded ID. Mark a line between the dimples with Ink P05−026.

(11) For engines with gasket groove on rear flange of HPC rear case (Post SB PW4ENG 72−48), install gasket to flange groove and secure in place with Paraffin Wax P05−059. See Figure 403.

NOTE: Engines prior to (SB PW4ENG 72−48) do not accept gasket at Flange K.

(12) Install two PWA 85751 Handling Brackets to diffuser case. See Figure 404.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

(c) Position double spool bracket in rear most two holes as marked on bracket.

(13) For PWA 85701 Guide, retract two setscrews on side of guide. Position PWA 85701 Guide or PWA 85308 Guide larger diameter end first on HPC rear hub and seat on seal seat shoulder. For PWA 85701 Guide, handtighten two set screws on side of guide.

(14) Install three PWA 85310 Alignment Pins into rear flange of HPC case. See Figure 403.

(a) Remove screws from storage locations in plate details of alignment pins.

(b) Locate three equally spaced 0.250−28 jackscrew holes in rear flange of HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through unthreaded holes in rear flange of HPC case. Secure pins with detail screws.

(15) With hoist, connect PWA 28657 Sling with two PWA 76154 Adapters to outer trunnion spools of PWA 85751 Brackets on diffuser case.

(16) With hoist position diffuser and combustor assembly over HPC rear hub. Align pins in HPC rear case with mating holes in diffuser case. With workbolts and nuts, seat diffuser case on HPC rear case.

(17) Remove work bolts, nuts, and PWA 85310 Pins. For PWA 85701 Guide, retract two setscrews on side of guide. Remove PWA 85701 or PWA 85308 Guide from HPC rear hub. See Figure 405.

(18) Remove PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(19) Install the Flange K hardware as follows: Refer to 72−00−41, Installation−20 (Task 72−00−41−420−020).

(20) Assemble PWA 85067 Fixture (406/3) to No. 3 bearing front seal seat (406/1). See Figure 406.

(21) Install fixture with seal seat polished face down over HPC rear hub and drift to seat if necessary. Remove fixture.

(22) Torque all bolts securing fuel supply tubes to Flange K brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(23) Assemble PWA 85068 Fixture (406/4) to No. 3 bearing seal spacer (406/3).

(24) Install fixture with seal spacer over HPC rear hub and drift to seat if necessary. Remove fixture.

(25) Heat the No. 3 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN INSULATED GLOVES TO PREVENT BEARING DAMAGE.

(26) Remove the heated inner race and rollers from the heat source.

(27) Install the heated No. 3 bearing inner race and rollers (407/1) onto HPC rear hub, puller grooves up. Seat bearing with PWA 85070 Drift (407/2) and keep constant downward pressure on bearing for approximately three minutes to make sure of correct seating. After seating remove drift. See Figure 407.

(28) After inner race has reached room temperature measure distance from end of HPC rear hub down to rear of inner race and rollers with depth gage. Record this distance as Dimension C. See Figure 402.

(29) Dimension C must not be less than previously taken Dimension B minus Dimension A.

NOTE: If Dimension C is less than required it indicates bearing is not fully seated.

(30) Remove PWA 85168 Protector (408/7) from diffuser case. See Figure 408.

(31) Heat No. 3 bearing housing.

(a) Install four PWA 85799 Pins (408/10) into the bearing housing channel nuts equally around housing.

(b) Install PWA 85795 Heater or PWA 85679 Heater (408/4) to rear flange of housing on PWA 85799 Pins. Connect power and thermocouple cables to PWA 29754 Control (408/9) or equivalent control.

NOTE: If PWA 85679 Heater is used, a heat shield must be made locally to protect the No. 3 bearing inner race and rollers.

(c) Set heater to 300°F (149°C) and heat housing for 55 − 60 minutes.

(32) After No. 3 bearing housing is correctly heated, turn off heater. Disconnect control and remove heater and four PWA 85799 Pins from housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(33) (Reference 1006) Install No. 3 bearing outer race (408/5) into bearing housing with serial number up and align "X" mark on outer race with ink mark between the two dimples on top of housing.

CAUTION: DO NOT HIT BEARING ROLLERS WITH THE DRIFT WHEN SEATING OUTER RACE.

(34) Position PWA 87433 Drift or PWA 85798 Drift (408/8) on outer race and seat race. Make sure outer race is seated against shoulder in housing. Remove the drift.

(35) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure bearing outer race is correctly seated. See Figure 402.

(a) Measure Distance F from top of No. 3 bearing housing to top of bearing outer race (402/7).

(b) Dimension F must not be less than previously taken Dimension E minus Dimension D.

NOTE: If Dimension F is less than required, it indicates outer race is not fully seated.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR.

CAUTION: NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED, NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO AVOID INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READING, NO. 3 BEARING AND HOUSING MUST BE AT ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

(36) Lubricate the No. 3 bearing outer race retaining nut (408/2) with Engine Oil P03−001.

(37) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(38) Install PWA 85168 Protector (408/1) to diffuser case.

(39) Install retaining nut into housing with slots up, handtighten.

(40) Slide PWA 86491 Driver or PWA 85797 Wrench (408/3) over HPC rear hub, locating the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(41) Mechanical Wrench Method (Optional) − See Figure 408, Sheet 2.

(a) Install PWA 102743 Torque Adapter (408/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (408/12) over PWA 102743 Torque Adapter (408/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (408/13) to engage both PWA 102743 Torque Adapter (408/11) and PWA 102744 Holder Adapter (408/12).

(42) (Reference 975) Torque retaining nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(43) Remove wrench/driver from the No. 3 bearing retaining nut.

(44) Remove the six workbolts from bearing housing.

(45) Install rivet (408/6) into aligned holes in the retaining nut and housing using PWA 85901 Riveter and flare rivet to secure.

(46) Install PWA 85159 Thread Protector (408/7) over HPC rear hub.

D. Postrequisites

(1) Connect/Install External Parts To Complete Installation Of Diffuser Combustor. Refer to 72-00-41, Installation-02 (Task 72-00-41-420-002).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From The Front End Down To The Horizontal Position. Refer to 72-00-00, Special Procedures-10 (Task 72-00-00-420-002-A00).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-03 (Task 72-00-41-420-003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/ Check-07 (Task 72-00-41-720-001).

(5) Install The Turbine Nozzle. Refer to 72-00-51, Installation-01 (Task 72-00-51-420-001).

(6) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72-00-34, Installation-04 (Task 72-00-34-450-002).

(8) Install The Fan Case. Refer to 72-00-33, Installation-01 (Task 72-00-33-420-001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(10) Install The Turbine Exhaust Case. Refer to 72-00-54, Installation-01 (Task 72-00-54-420-001.

(11) Install The Low Pressure Compressor. Refer to 72-00-31, Installation-01 (Task 72-00-31-420-003).

(12) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72-00-32, Installation-01 (Task 72-00-32-420-001).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−16

(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72−00−31−420−002−002).

(14) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(15) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).

No. 3 Bearing Outer Race Installation
Figure 408 (Sheet 2)
(Task 72−00−41−420−018)

Task 72−00−41−420−019:

1. Install Diffuser And Combustor (Horizontal) Without No. 3 Bearing Outer Race Previously Installed

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: See 72−00−41, Installation−12 Task 72−00−41−420−014 for the optional procedure with the No. 3 bearing outer race installed. The outer race was installed into the diffuser combustor group before installation onto the HPC.

A. Prerequisites

(1) See 72−00−41, Inspection/Check−01 Task 72−00−41−990−001 for interface fits and clearances. Special torques and special assembly procedures show where necessary in the text that follows and are identified by a reference number. For Example: (Reference 1234) Torque the retaining nut as follows:

(2) Assemble the diffuser and combustor by 72−41−00, Assembly−01 Task 72−41−00−400−001−A00.

B. Equipment And Materials Required

Standard Tools:

0.250−28 Jackscrews (Four Necessary)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling
PWA 29754	Control (Or Equivalent)
PWA 76154	Adapter (Two Necessary)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85308	Guide (Optional To PWA 85701)
PWA 85310	Pin, Alignment (Three Necessary)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85701	Guide
PWA 85751	Bracket (Two Necessary)

Special Tools:

(CONTINUED)

PWA 85795	Heater
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85798	Drift (Optional To PWA 87433)
PWA 85799	Pins, Guide And Support
PWA 85893	Support
PWA 85901	Riveter
PWA 85909	Adapter
PWA 85910	Adapter
PWA 85983	Adapter, Stabilizer (Two Necessary Twin Overhead Rail System Only)
PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

	Item No.	Designation
	P03−001	Engine Oil (PWA 521B)
	P05−026	Ink (Marking) (PMC 4057−1)
	P05−059	Wax, Paraffin (PMC 9552)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
R	P05−292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−41/1/1
Rivet	1	72−41−00/12/40

C. Procedure

See Figure 401, Figure 402, Figure 403, Figure 404, Figure 405, Figure 406, Figure 407 and Figure 408.

(1) Remove the PWA 85159 Thread Protector and PWA 85428 Knife−Edge Protector from the HPC rear hub.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(2) Make a visual inspection of the HPC rear drum OD thrust balance knife−edge by 72−00−35, Inspection/Check−04 (visual only) Task 72−00−35−210−004. Reject the airseal with cracks found by visual inspection.

(3) Put the No. 3 bearing assembly on clean waxed paper on the bench.

(4) Remove the outer race (402/7) from the inner race and rollers (402/3) and put them, serial number up, on the bench.

(5) Make sure the bearing inner and outer race part numbers are the same.

CAUTION: THE THICKNESS OF THE NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THE THINNER, ID, SECTION OF THE SEAL SEAT OR INCORRECT DIMENSIONS WILL RESULT.

(6) Measure the thickness of the No. 3 bearing front seal seat (402/1) across the thinner ID section of the seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness and the No. 3 bearing inner race and rollers (402/3) thickness. Make a record of this total thickness as Dimension A.

(7) Measure the distance from the end of the HPC rear hub (402/4) down to the seal seat shoulder (402/5) on the hub. Make a record of this dimension as Dimension B.

NOTE: Dimensions A and B are used to do a seating check later during this installation procedure.

(8) Measure the thickness of the No. 3 bearing outer race (402/7) thickness. Make a record of this dimension as Dimension D.

(9) Measure distance from the top of the No. 3 bearing support to the outer race seating shoulder. Make a record of this dimension as Dimension E.

NOTE: Dimensions D and E are used to do a seating check later during this installation procedure.

(10) Find the two dimples on the top surface of the No. 3 bearing housing (402/6) threaded ID. Make a mark between the dimples with Ink P05−026.

(11) Install a gasket to the flange groove and attach in position with Paraffin Wax P05−059. See Figure 403.

(12) Install two PWA 85751 Handling Brackets to the diffuser case. See Figure 404.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapters with PWA 85751 Brackets.

(a) Loosen and remove the clamp bolts that attach the fuel tubes to the Flange K bracket for PWA 85751 Bracket tool installation clearance.

(b) Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations, install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of the diffuser case rear flange and attach with detail nuts and bolts.

(c) Install the double spool bracket in the rear most two holes as marked on the bracket.

(13) For PWA 85701 Guide, retract the two setscrews on the side of the guide. Install the PWA 85701 Guide or PWA 85308 Guide larger diameter end first on the HPC rear hub and seat on the seal seat shoulder. For PWA 85701 Guide, handtighten two setscrews on the side of the guide.

(14) Install three PWA 85310 Alignment Pins into the rear flange of the HPC case. See Figure 403.

(a) Remove the screws from the storage locations in the plate details of the alignment pins.

(b) Find the three equally spaced 0.250−28 jackscrew holes in the rear flange of the HPC case.

(c) Insert three equally spaced alignment pins (dowel pins up) through the unthreaded holes in the rear flange of the HPC case. Attach the pins with detail screws.

(15) With a hoist, connect the PWA 28657 Sling with two PWA 76154 Adapters to the outer trunnion spools of the PWA 85045 Brackets on the diffuser case.

(16) With a hoist install the diffuser and combustor assembly over the HPC rear hub. Align the pins in the HPC rear case with the mating holes in the diffuser case. With workbolts and nuts, seat the diffuser case on the HPC rear case.

(17) Remove the work bolts, nuts, and PWA 85310 Pins. For PWA 85701 Guide, retract the two setscrews on the side of the guide. Remove the PWA 85701 Guide or PWA 85308 Guide from the HPC rear hub. See Figure 405.

(18) Remove the PWA 28657 Sling, PWA 76154 Adapters and PWA 85751 Brackets.

(19) Install the Flange K hardware as follows: Refer to 72-00-41, Installation-20 (Task 72-00-41-420-020).

(20) Install the PWA 85067 Fixture (406/3) to the No. 3 bearing front seal seat (406/1). See Figure 406.

(21) Install the fixture with the seal seat polished face down over the HPC rear hub and drift to seat if necessary. Remove the fixture.

(22) Install the PWA 85068 Fixture (406/4) to the No. 3 bearing seal spacer (406/3).

(23) Install the fixture with the seal spacer over the HPC rear hub and drift to seat if necessary. Remove the fixture.

(24) Heat the No. 3 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

CAUTION: WEAR CLEAN INSULATED GLOVES WHEN YOU TOUCH THE NO. 3 BEARING INNER RACE AND ROLLERS TO PREVENT BEARING DAMAGE.

(25) Remove the heated inner race and rollers from the heat source.

(26) Install the heated No. 3 bearing inner race and rollers (407/1) onto the HPC rear hub, puller grooves up. Seat the bearing with PWA 85070 Drift (407/2) and keep constant downward pressure on the bearing for approximately three minutes to make sure of correct seating. After seating remove the drift. See Figure 407.

(27) After the inner race has reached room temperature measure the distance from the end of the HPC rear hub down to the rear of the inner race and rollers with a depth gage. Make a record of this distance as Dimension C. See Figure 402.

(28) Dimension C must not be less than Dimension B minus Dimension A.

NOTE: An indication that the bearing is not fully seated is when Dimension C is less than necessary.

(29) Remove the PWA 85168 Protector (410/7) from the diffuser case. See Figure 410.

(30) Heat the No. 3 bearing housing.

NOTE: If PWA 85679 Heater is used, you must make a heatshield to protect the No. 3 bearing inner race and rollers.

(a) Install four PWA 85799 Pins (408/10) into the bearing housing channel nuts equally around the housing.

(b) Install PWA 85795 Heater or PWA 85679 Heater (408/4) to the rear flange of the housing. Connect power and thermocouple cables to the PWA 29754 Control (408/9) or equivalent control.

(c) Set the heater to 300°F (149°C) and heat the housing for 55 − 60 minutes.

(31) After the No. 3 bearing housing is correctly heated turn off the heater. Disconnect the control and remove the heater and four PWA 85799 Pins from the housing.

CAUTION: WEAR CLEAN LINT FREE GLOVES WHEN YOU TOUCH THE NO 3 BEARING OUTER RACE TO PREVENT BEARING DAMAGE.

(32) (Reference 1006) Install the No. 3 bearing outer race (408/5) into the bearing housing with the serial number up and align the "X" mark on the outer race with the ink mark between the two dimples on the top of housing.

CAUTION: DO NOT HIT THE BEARING ROLLERS WITH THE DRIFT WHEN YOU SEAT THE OUTER RACE.

(33) Install the PWA 87433 Drift or PWA 85798 Drift (408/8) on the outer race and seat the race. Make sure the outer race is seated against the shoulder in the housing. Remove the drift.

(34) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure the bearing outer race is correctly seated. See Figure 402.

(a) Measure the Distance F from the top of the No. 3 bearing housing to the top of the bearing outer race (402/7).

(b) Dimension F must not be less than Dimension E minus Dimension D.

NOTE: An indication that the outer race is not fully seated is when Dimension F is less than necessary.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS CAN OCCUR.

CAUTION: THE NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER YOU TORQUE THE NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION BEFORE THE ENGINE IS OPERATED, THE NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO PREVENT INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READINGS, THE NO. 3 BEARING AND HOUSING MUST

BE AT ROOM TEMPERATURE. SHOP AIR CAN BE USED FOR COOLING. DO NOT USE DRY ICE.

(35) Lubricate the No. 3 bearing outer race retaining nut (408/2) with Engine Oil P03−001.

(36) Install six workbolts, lubricated with Engine Oil P03−001, into the bearing housing channel nuts equally around the housing. Torque the workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(37) Install the PWA 85168 Protector (408/1) to the diffuser case.

(38) Install retaining nut into housing with slots up, handtighten.

(39) Slide PWA 86491 Driver or PWA 85797 Wrench (406/3) over the HPC rear hub, install the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(40) Mechanical Wrench Method (Optional) − See Figure 408, Sheet 2.

(a) Install PWA 102743 Torque Adapter (408/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (408/12) over PWA 102743 Torque Adapter (408/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (408/13) to engage both PWA 102743 Torque Adapter (408/11) and PWA 102744 Holder Adapter (408/12).

(41) (Reference 975) Torque retaining nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(42) Remove the wrench/driver from the No. 3 bearing retaining nut.

(43) Remove the six workbolts from the bearing housing.

(44) Install the rivet (408/6) to the aligned holes in the retaining nut and housing. Use the PWA 85901 Riveter and flare the rivet to attach.

(45) Install the PWA 85159 Thread Protector (408/7) over the HPC rear hub.

D. Postrequisites

(1) Connect/Install The External Parts To The Complete Installation Of The Diffuser Combustor. Refer to 72−00−41, Installation−02 (Task 72−00−41−420−005).

(2) Trunnion The Intermediate Case Through Diffuser And Combustor Case From The Front End Down To The Horizontal Position. Refer to 72−00−00, Special Procedures−10 (Task 72−00−00−420−002−A).

(3) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72−00−41, Installation−03 (Task 72−00−41−420−003).

(4) Vacuum Check The No. 3 Bearing Compartment. Refer to 72−00−41, Inspection/Check−07 (Task 72−00−41−720−001).

(5) Install The Turbine Nozzle. Refer to 72−00−51, Installation−01 (Task 72−00−51−420−001).

(6) Install The High Pressure Turbine − Horizontal by 72−00−52, Installation−01 (Task 72−00−52−420−001).

(7) Install The No. 1 Bearing Support Assembly. Refer to 72−00−34, Installation−04 (Task 72−00−34−450−002).

(8) Install The Fan Case. Refer to 72−00−33, Installation−01 (Task 72−00−33−420−001).

(9) Install The Low Pressure Turbine With Shaft. Refer to 72−00−53, Installation−01 (Task 72−00−53−420−001).

(10) Install The Turbine Exhaust Case. Refer to 72−00−54, Installation−01 (Task 72−00−54−420−001).

(11) Install The Low Pressure Compressor. Refer to 72−00−31, Installation−01 (Task 72−00−31−420−003).

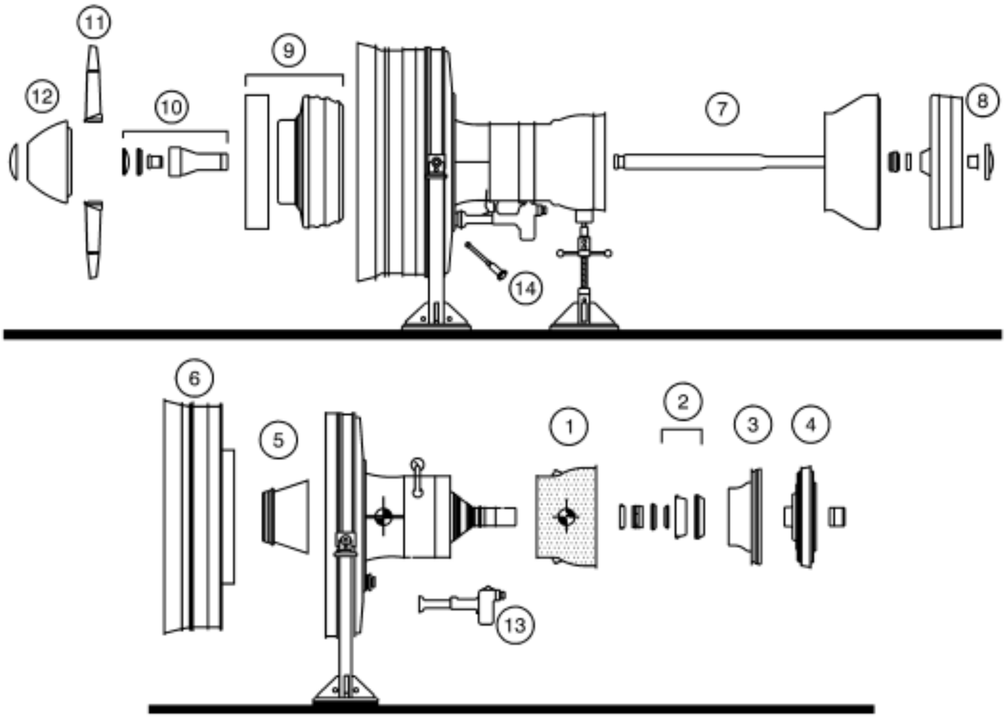
(12) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72−00−32, Installation−01 (Task 72−00−32−420−001).

(13) Install The Stage 1 LPC Blade Assemblies. Refer to 72−00−31, Installation−04 (Task 72−00−31−420−002−002).

(14) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(15) Install The Main Gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001).

(16) Install The Electronic Engine Control (EEC) Speed Transducer (N1). Refer to 72−00−34, Installation−03 (Task 72−00−34−450−001).



1. INSTALL DIFFUSER AND COMBUSTOR.
2. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY AND REAR SEAL SEAT.
3. INSTALL TURBINE NOZZLE.
4. INSTALL HIGH PRESSURE TURBINE (HPT).
5. INSTALL NO. 1 BEARING SUPPORT ASSEMBLY.
6. INSTALL FAN CASE.
7. INSTALL LOW PRESSURE TURBINE (LPT).
8. INSTALL TURBINE EXHAUST CASE.
9. INSTALL LOW PRESSURE COMPRESSOR (LPC).
10. INSTALL LPC/LPT COUPLING.
11. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
12. INSTALL COMPRESSOR INLET CONE.
13. INSTALL MAIN GEARBOX.
14. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

Task 72-00-41-440-001:

1. Install No. 3 Bearing (Vertical)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

PWA 29754	Control (Or Equivalent)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85310	Pin, Alignment (Three Required)
PWA 85679	Heater (Optional To PWA 85795)
PWA 85795	Heater
PWA 85797	Wrench (Optional To PWA 86491)
PWA 85798	Drift (Optional To PWA 87433)
PWA 85901	Riveter
PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P05-026	Ink (Marking) (PMC 4057-1)

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−17

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	1	72−41−00/12/1

C. Procedure
See Figure 402 and Figure 403.

(1) Remove PWA 85159 Thread Protector from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(2) Place No. 3 bearing assembly on clean waxed paper on bench.

(3) Separate outer race (403/2) from inner race and rollers (402/1) and place them, serial number up, on bench.

(4) Verify bearing inner and outer race serial numbers are the same.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(5) Measure thickness of the No. 3 bearing front seal seat (402/3) across the thinner ID section of seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/1) thickness. Record this thickness as Dimension A.

(6) Measure distance from end of HPC rear hub (402/4) down to seal spacer shoulder (402/5) on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(7) Measure thickness of No. 3 bearing outer race (403/2) thickness. Record this dimension as Dimension D.

(8) Measure distance from top of No. 3 bearing support to outer race seating shoulder. Record this dimension as Dimension E.

NOTE: Dimensions D and E will be used to perform a seating check later during this installation procedure.

(9) Locate two dimples on top surface of No. 3 bearing housing (403/1) threaded ID. Mark a line between the dimples with Ink P05−026.

(10) Assemble a PWA 85067 Fixture (404/3) onto the No. 3 bearing front seal seat (404/4). See Figure 404.

(11) Install the fixture with the seal seat, polished face down, over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(12) Assemble a PWA 85068 Fixture (404/1) onto the No. 3 bearing seal spacer (404/2).

(13) Install the fixture with the spacer over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(14) Heat the No. 3 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN INSULATED GLOVES TO PREVENT BEARING DAMAGE.

(15) Remove the heated inner race and rollers from the heat source.

(16) Install the heated No. 3 bearing inner race and rollers (405/2) onto HPC rear hub, puller grooves up. Seat bearing with PWA 85070 Drift (405/1) and keep constant downward pressure on bearing for approximately three minutes to make sure of correct seating. After seating remove drift. See Figure 405.

(17) After inner race has reached room temperature measure distance from end of HPC rear hub down to rear of inner race and rollers with depth gage. Record this distance as Dimension C. See Figure 402.

(18) Dimension C must not be less than previously taken Dimension B minus Dimension A.

NOTE: If Dimension C is less than required it indicates bearing is not fully seated.

(19) Remove PWA 85168 Protector (406/4) from diffuser case. See Figure 406.

(20) Heat No. 3 bearing housing.

NOTE: If PWA 85679 Heater is used a heat shield must be made locally to protect the No. 3 bearing inner race and rollers.

(a) Install PWA 85795 Heater or PWA 85679 Heater (406/5) to rear flange of housing. Connect power and thermocouple cables to PWA 29754 Control (406/3) or equivalent control.

(b) Set heater to 300°F (149°C) and heat housing for 55 − 60 minutes.

(21) After No. 3 bearing housing is correctly heated turn off heater. Disconnect control and remove heater from housing.

CAUTION: HANDLE NO. 3 BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(22) (Reference 1006) Install No. 3 bearing outer race (406/6) into bearing housing with serial number up and align "X" mark on outer race with ink mark between the two dimples on top of housing.

CAUTION: DO NOT HIT BEARING ROLLERS WITH THE DRIFT WHEN SEATING OUTER RACE.

(23) Position PWA 87433 Drift or PWA 85798 Drift (406/2) on outer race and seat race. Make sure outer race is seated against shoulder in housing. Remove the drift.

(24) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure bearing outer race is correctly seated. See Figure 403.

(a) Measure Distance F from top of No. 3 bearing housing to top of bearing outer race (403/2).

(b) Dimension F must not be less than previously taken Dimension E minus Dimension D.

NOTE: If Dimension F is less than required, it indicates outer race is not fully seated.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR.

CAUTION: NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED, NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO AVOID INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READING, NO. 3 BEARING AND HOUSING MUST BE AT ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

(25) Lubricate the No. 3 bearing outer race retaining nut (406/8) with Engine Oil P03−001.

(26) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(27) Install PWA 85168Protector (406/4) to diffuser case.

(28) Install retaining nut into housing with slots up, handtighten.

(29) Slide PWA 86491 Driver or PWA 85797 Wrench (406/10) over HPC rear hub, locating the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(30) Mechanical Wrench Method (Optional) − See Figure 406, Sheet 2.

(a) Install PWA 102743 Torque Adapter (406/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (406/12) over PWA 102743 Torque Adapter (406/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (406/13) to engage both PWA 102743 Torque Adapter (406/11) and PWA 102744 Holder Adapter (406/12).

(31) (Reference 975) Torque retaining nut to 3600 - 4400 lb-in. (406.745 - 497.133 N.m). Turn through angle of 16° - 17° 30'. Loosen to 0 lb-in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(32) Remove wrench/driver from the No. 3 bearing retaining nut.

(33) Remove the six workbolts from bearing housing.

(34) Install rivet (406/7) into aligned holes in the retaining nut and housing using PWA 85901 Riveter and flare rivet to secure.

(35) Install PWA 85159 Thread Protector (406/1) over HPC rear hub.

D. Postrequisites

(1) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72-00-41, Installation-09 (Task 72-00-41-420-004).

(2) Vacuum Check The No. 3 Bearing Compartment. Refer to 72-00-41, Inspection/Check-07 (Task 72-00-41-720-001).

(3) Install The Turbine Nozzle. Refer to 72-00-51, Installation-02 (Task 72-00-51-420-002).

(4) Install The High Pressure Turbine - Vertical. Refer to 72-00-52, Installation-08 (Task 72-00-52-420-002).

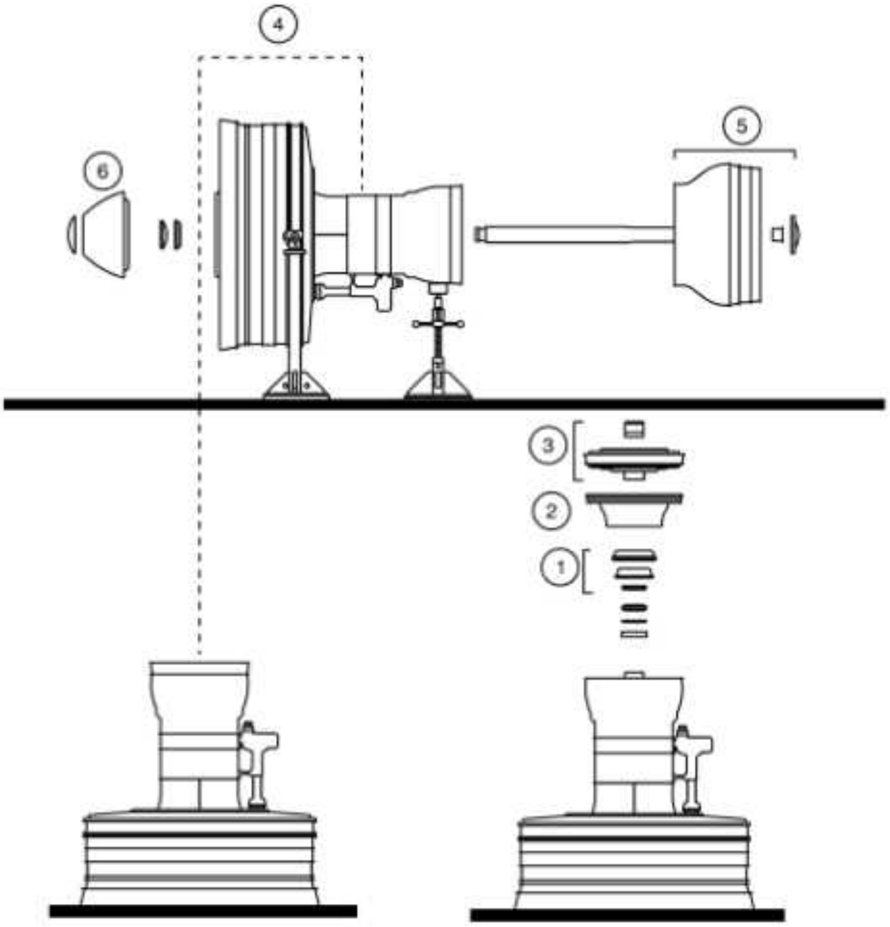
(5) Trunnion The Fan Cases Through HPT From Front End Down To Horizontal Position. Refer to 72-00-00, Special Procedures-13 (Task 72-00-00-420-003).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−17

(6) Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft. Refer to 72−00−53, Installation−08 (Task 72−00−53−420−002).

(7) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−17



1. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY
2. INSTALL TURBINE NOZZLE
3. INSTALL HIGH PRESSURE TURBINE (HPT)
4. TRUNNION FAN CASES THROUGH HPT TO HORIZONTAL
5. INSTALL LPT/TEC WITH SHAFT
6. INSTALL COMPRESSOR INLET CONE

Task 72-00-41-440-002:

1. Install No. 3 Bearing (Horizontal)

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See 72-00-41, Inspection/Check-01 Task 72-00-41-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For Example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

PWA 29754	Control (Or Equivalent)
PWA 80187	Multiplier, Torque
PWA 85067	Fixture
PWA 85068	Fixture
PWA 85070	Drift
PWA 85159	Protector
PWA 85168	Protector
PWA 85310	Pin, Alignment (Three Required)
PWA 85679	Heater (Optional To PWA 85795)

PWA 86491	Driver, Torque
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P05-026	Ink (Marking) (PMC 4057-1)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	1	72−41−00/12/40

C. Procedure
See Figure 402 and Figure 403.

NOTE: PWA 85893 Support and PWA 85910 Adapter have been previously installed. Reference 72−00−41, Removal−18 Task 72−00−41−040−002.

(1) Remove PWA 85159 Thread Protector from HPC rear hub.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN LINT FREE GLOVES TO PREVENT BEARING DAMAGE.

(2) Place No. 3 bearing assembly on clean waxed paper on bench.

(3) Separate outer race (403/1) from inner race and rollers (402/2) and place them, serial number up, on bench.

(4) Verify bearing inner and outer race serial numbers are the same.

CAUTION: THICKNESS OF NO. 3 BEARING FRONT SEAL SEAT MUST BE MEASURED ACROSS THINNER, ID, SECTION OF SEAL SEAT OR INCORRECT DIMENSION WILL RESULT.

(5) Measure thickness of the No. 3 bearing front seal seat (402/3) across the thinner ID section of seal seat. Measure the No. 3 bearing seal spacer (402/2) thickness, No. 3 bearing inner race and rollers (402/1) thickness. Record this thickness as Dimension A.

(6) Measure distance from end of HPC rear hub (402/4), to the seal spacer shoulder the on hub. Record this dimension as Dimension B.

NOTE: Dimensions A and B will be used to perform a seating check later during this installation procedure.

(7) Measure thickness of No. 3 bearing outer race (403/1) thickness. Record this dimension as Dimension D.

(8) Measure distance from top of No. 3 bearing support to outer race seating shoulder. Record this dimension as Dimension E.

NOTE: Dimensions D and E will be used to perform a seating check later during this installation procedure.

(9) Locate two dimples on top surface of No. 3 bearing housing (403/2) threaded ID. Mark a line between the dimples with Ink P05−026.

(10) Assemble a PWA 85067 Fixture (404/2) onto the No. 3 bearing front seal seat (404/1). See Figure 404.

(11) Install the fixture with the seal seat, polished face down, over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(12) Assemble a PWA 85068 Fixture (404/4) onto the No. 3 bearing seal spacer (404/3).

(13) Install the fixture with the spacer over the HPC rear hub and drift to seat, if necessary. Remove the fixture.

(14) Heat the No. 3 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

CAUTION: HANDLE NO. 3 BEARING INNER RACE AND ROLLERS WITH CLEAN INSULATED GLOVES TO PREVENT BEARING DAMAGE.

(15) Remove the heated inner race and rollers from the heat source.

(16) Install the heated No. 3 bearing inner race and rollers (405/1) onto HPC rear hub, puller grooves up. Seat bearing with PWA 85070 Drift (405/2) and keep constant inward pressure on bearing for approximately three minutes to make sure of correct seating. After seating remove drift. See Figure 405.

(17) After inner race has reached room temperature measure distance from end of HPC rear hub to rear of inner race and rollers with depth gage. Record this distance as Dimension C. See Figure 402.

(18) Dimension C must not be less than previously taken Dimension B minus Dimension A.

NOTE: If Dimension C is less than required it indicates bearing is not fully seated.

(19) Remove PWA 85168 Protector (406/1) from diffuser case. See Figure 406.

(20) Heat No. 3 bearing housing.

(a) Install four PWA 85799 Pins (406/10) into the bearing housing channel nuts equally around housing.

(b) Install PWA 85795 Heater or PWA 85679 Heater (406/4) to rear flange of housing on PWA 85799 Pins. Connect power and thermocouple cables to PWA 29754 Control (406/9) or equivalent control.

NOTE: If PWA 85679 Heater is used, a heat shield must be made locally to protect the No. 3 bearing inner race and rollers.

(c) Set heater to 300°F (149°C) and heat housing for 55 − 60 minutes.

(21) After No. 3 bearing housing is correctly heated turn off heater. Disconnect control and remove heater from housing.

CAUTION: HANDLE NO 3. BEARING OUTER RACE WITH CLEAN GLOVES TO PREVENT BEARING DAMAGE.

(22) (Reference 1006) Install No. 3 bearing outer race (406/5) into bearing housing with serial number up and align "X" mark on outer race with ink mark between the two dimples on top of housing.

CAUTION: DO NOT HIT BEARING ROLLERS WITH THE DRIFT WHEN SEATING OUTER RACE.

(23) Position PWA 87433 Drift or PWA 85798 Drift (406/8) on outer race and seat race. Make sure outer race is seated against shoulder in housing. Remove the drift.

(24) After the No. 3 bearing temperature has returned to room temperature, do a dimensional check to make sure bearing outer race is correctly seated. See Figure 403.

(a) Measure Distance F from top of No. 3 bearing housing to top of bearing outer race (403/1).

(b) Dimension F must not be less than previously taken Dimension E minus Dimension D.

NOTE: If Dimension F is less than required, it indicates outer race is not fully seated.

CAUTION: A NEW OR SILVER PLATED NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR.

CAUTION: NO. 3 BEARING OUTER RACE RETAINING NUT MUST BE SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED, NUT CAN BE SILVER PLATED PER PW4000 SERIES CIR, PN 51A357.

CAUTION: TO AVOID INCORRECT BEARING OUTER RACE DIMENSIONAL CHECKS AND RETAINING NUT TORQUE READING, NO. 3 BEARING AND HOUSING MUST BE AT ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

(25) Lubricate the No. 3 bearing outer race retaining nut (406/2) with Engine Oil P03−001.

(26) Install six workbolts, lubricated with Engine Oil P03−001, into bearing housing channel nuts equally around housing. Torque workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts are a quality standard bolt with .375−24 by 1.000 inch (25.400 mm) thread length.

(27) Install PWA 85168 Protector (406/1) to diffuser case.

(28) Install retaining nut into housing with slots up, handtighten.

(29) Slide PWA 86491 Driver or PWA 85797 Wrench (406/3) over HPC rear hub, locating the teeth of the tool in the slots of the nut.

NOTE: If you use PWA 86491 Driver, you must attach the driver to the bearing housing with the four detail cap screws.

(30) Mechanical Wrench Method (Optional) − See Figure 406Figure 406, Sheet 2.

(a) Install PWA 102743 Torque Adapter (406/11) to engage the slots in the bearing retaining nut.

(b) Install PWA 102744 Holder Adapter (406/12) over PWA 102743 Torque Adapter (406/11) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

(c) Install PWA 80187 Torque Multiplier (406/13) to engage both PWA 102743 Torque Adapter (406/11) and PWA 102744 Holder Adapter (406/12).

(31) (Reference 975) Torque retaining nut to 3600 − 4400 lb−in. (406.8 − 497.3 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut with one rivet hole in housing.

(32) Remove wrench/driver from the No. 3 bearing retaining nut.

(33) Remove the six workbolts from bearing housing.

(34) Install rivet (406/6) into aligned holes in the retaining nut and housing with PWA 85901 Riveter and flare rivet to secure.

(35) Install PWA 85159 Thread Protector (406/7) over HPC rear hub.

D. Postrequisites

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−18

(1) Install The No. 3 Bearing Seal Assembly And Seal Seat. Refer to 72−00−41, Installation−03 (Task 72−00−41−420−003).

(2) Vacuum Check The No. 3 Bearing Compartment. Refer to 72−00−41, Inspection/Check−07 (Task 72−00−41−720−001).

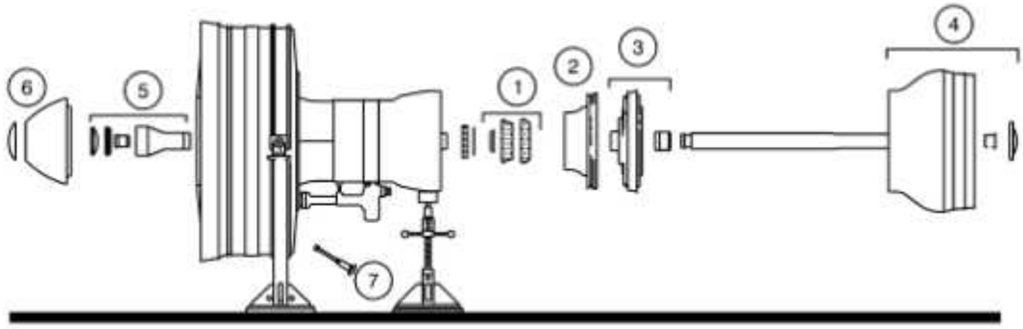
(3) Install The Turbine Nozzle. Refer to 72−00−51, Installation−01 (Task 72−00−51−420−001).

(4) Install The High Pressure Turbine − Horizontal. Refer to 72−00−52, Installation−01 (Task 72−00−52−420−001).

(5) Install The Low Pressure Trbine And Turbine Exhaust Case With Shaft. Refer to 72−00−53, Installation−08 (Task 72−00−53−420−002).

(6) Install The LPC/LPT Coupling (With The Front Compressor Drive Turbine Shaft Installed). Refer to 72−00−32, Installation−01 (Task 72−00−32−420−001).

(7) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).



1. INSTALL NO. 3 BEARING REAR SEAL ASSEMBLY
2. INSTALL TURBINE NOZZLE
3. INSTALL HIGH PRESSURE TURBINE (HPT)
4. INSTALL LPT/TEC WITH SHAFT
5. INSTALL LPC/LPT COUPLING ASSEMBLY
6. INSTALL COMPRESSOR INLET CONE
7. INSTALL N1 SPEED SENSOR

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSTALLATION−20

Task 72−00−41−420−020:

1. Install The Flange K Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
R	P06−054	Paste, Antiseize (PWA 36246)

B. Procedure

(1) Install Flange K hardware as follows: See Figure 401.

(a) Install fifteen bolts, threads lubricated with Antiseize Paste P06−054, to brackets at holes 32 through 36, 58 through 62, and 84 through 88 handtight only. Wipe off unwanted paste. R R

(b) Install remaining bolts, threads lubricated with Engine Oil P03−001, and secure with washers and nuts.

NOTE: Washers used under hexagon nuts at holes 26, 27, 31, 99, and 100 only.

(2) (Reference 978) Tighten all Flange K bolts in sets of two groups with groups located opposite each other. The sets must have approximately 16 groups with eight bolts in each group. See Figure 402.

NOTE: Eight of the 16 groups have eight bolts each. The remaining eight groups have seven bolts each. See referenced figure.

(a) Torque flange bolts 32 through 36, 58 through 62 and 84 through 88 to initial torque of 60 − 70 lb−in. (6.779 − 7.909 N.m). Torque all remaining bolts 75 − 100 lb−in. (8.474 − 11.298 N.m).

(b) Final torque bolts 32 through 36, 58 through 62 and 84 through 88 to 130 − 140 lb−in. (14.688 − 15.818 N.m). Torque all remaining bolts 180 − 200 lb−in. (20.337 − 22.597 N.m).

(c) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at holes 32 through 36, 58 through 62, and 84 through 88.

(3) (Reference 1011) Loosen the four bolts that attach the brackets (items 170 and 180). Install the PWA 87501 Pin through the outer holes of the two brackets. Torque the bolts again to the correct torque. The tool pin will hold the bracket outer holes in 0.0015 inch (0.038 mm) concentricity of each other. Remove the tool pin.

(4) Install two bolts, lubricated with Engine Oil P03−001, and nut to secure fuel flow divider valve bracket to previously installed Flange J bracket.

(a) Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) Torque all bolts securing fuel supply tubes to Flange K brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(6) Remove any tags or markings on the brackets or flange.

(7) Examine the assembly for foreign objects, damage, and correct assembly.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - CLEANING-01

Task 72-00-41-160-001:

1. Clean Igniter Plug
   A. Equipment And Materials Required - None
   B. Procedure
      (1) Outer Shell

WARNING: CLEANING SOLVENT IS FLAMMABLE. USE IN WELL VENTILATED AREA. AVOID CONTACT WITH SKIN.

(a) Degrease igniter plug by SPOP 208 Wipe Method (Task 70-21-00-110-040).

NOTE: Cleaning of recessed center electrode cavity on firing end of igniter plug is not recommended.

(b) Clean outer shell of igniter plug using wire brush.
(c) Use the SPOP 208 Wipe Method (Task 70-21-00-110-040), and a nonmetallic brush, remove deposits from external surface of firing end of igniter plug. It is not necessary to restore ceramic to cleanliness of new ceramic surface.

(2) Contact Well
(a) Remove dirt or foreign matter from inside contact well with compressed air.

NOTE: Compressed air shall be maintained at 30 psig (206.8 kPa) maximum discharge pressure. Dirt on contact surface will cause reduced output or arcing.

(b) Minor arcing of the contact button can be removed by resurfacing the button with abrasive rod, using a circular movement of the hand.

WARNING: USE CLEANING SOLVENT IN WELL-VENTILATED AREA. AVOID CONTACT WITH SKIN.

(c) Clean igniter plug contact well with long bristle, nonmetallic brush and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air.
(d) Clean inner ceramic walls using circular felt bob, 1/2 inch (12.7 mm) in diameter and approximately 1 3/4 inches (44.450 mm) long, suitable for use with hand chuck. Clean with the SPOP 208 Wipe Method (Task 70-21-00-110-040).

(e) Clean end surface of ceramic at seat of grommet face using short bristle nonmetallic brush and the SPOP 208 Wipe Method (Task 70−21−00−110−040).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - CLEANING-02

Task 72-00-41-160-002:

1. Clean Exciter-To-Igniter Plug Cable

A. Equipment And Materials Required

Consumable Material:

Item No.	Description
P05-017	Wipers, Cotton (Lint Free)
P05-050	Abrasive Rod, Rubberized

B. Procedure

(1) Remove dirt or foreign matter from inside spring with compressed air.

NOTE: Compressed air shall be maintained at 30 psig (206.8 kPa) maximum discharge pressure.

WARNING: USE CLEANING SOLVENT IN WELL-VENTILATED AREA. AVOID CONTACT WITH SKIN.

(2) Wipe high tension sleeve clean using clean Lint Free Cotton Wipers (P05-017), and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air.

(3) Wipe conduit assembly with clean Lint Free Cotton Wipers (P05-017), and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air.

(4) Minor arcing and discoloration of contact button can be removed by resurfacing button with Rubberized Abrasive Rod (P05-050), using a circular hand motion.

(5) Clean high tension contact as required using clean Lint Free Cotton Wipers (P05-017), and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − CLEANING−03

Task 72−00−41−160−003:

1. Clean Fuel Distribution Valve Strainer (Solvent)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P05−058	Brush, Stiff Bristle Nonmetallic
P11−027	Solvent, Petroleum (PMC 9001)

B. Procedure

CAUTION: DO NOT USE PAPER TO CLEAN OR DRY THE STRAINER. LINT FROM THE PAPER CAN CAUSE BLOCKAGE DOWNSTREAM.

DO NOT CLEAN THE STRAINER WITH A WIRE BRUSH, A PROBE OR ANY EQUIVALENT DEVICE. THESE DEVICES CAN CAUSE DAMAGE TO THE WIRE MESH SCREEN.

(1) Clean the strainer as follows, (small quantities of contamination).
   (a) Put the strainer in a container filled with Petroleum Solvent (P11−027).
   (b) Move the strainer quickly in the solvent to loosen the contamination.
   (c) Remove the strainer from the container.
   (d) Clean the wire mesh screen of the strainer with dry compressed air at 30 psi (200 kPa) maximum to remove the contamination deposits.
(2) Clean the strainer as follows, (large quantities of contamination).
   (a) Put the strainer in a container filled with Petroleum Solvent (P11−027) and let the strainer soak for ten minutes.
   (b) Move the strainer quickly in the solvent to loosen the contamination.
   (c) Remove the strainer from the container.
   (d) Clean the wire mesh screen of the strainer with a Stiff Bristle Nonmetallic Brush (P05−058) to remove the contamination deposits.

(3) Put a light inside, or behind the strainer to check for contamination deposits after the cleaning procedure. Do the cleaning procedure again if any contaminant is in the screens. If you see that more than approximately 10 percent of the filtering area of the screen has contamination deposits after cleaning, replace the strainer.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - CLEANING-04

Task 72-00-41-110-001:

1. Clean Fuel Distribution Valve Strainer (Ultrasonic)
   A. Equipment And Materials Required - None
   B. Procedure

CAUTION: DO NOT ATTEMPT CLEANING WITH A WIRE BRUSH, PROBE OR OTHER DEVICE WHICH MAY DAMAGE WIRE MESH SCREEN.

(1) Place strainer in an ultrasonic cleaner filled with a solution of water and wetting agent, mixed per manufacturer's instructions.
(2) Sonic clean, as required, to remove contamination.
(3) Insert a light inside strainer to check results of cleaning procedure. Repeat procedure if any contaminants remain in screen. If inspection reveals that more than approximately 10 percent of filtering area remains contaminated after completion of the foregoing instructions, strainer must be replaced.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSPECTION/CHECK−01

Task 72−00−41−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts.Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-02

Task 72-00-41-210-002:

1. Inspect Ignition System
   - A. Equipment And Materials Required - None
   - B. Procedure
     - (1) General
       - (a) Following procedures are normal inspection functions. Nature of engine operations determines time interval allowed between inspections.

WARNING: IGNITION SYSTEM IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

- (2) Inspect ignition system for security of components, wire braid fraying, and for obstruction of cooling air passages.
- (3) Inspect ignition exciter terminal well for arcing and tracking. See 72-00-61, Inspection/Check-01 (Task 72-00-61-210-001).
- (4) Inspect exciter-to-igniter plug cable terminal ends for arcing and tracking. See Inspection/Check-04 (Task 72-00-41-210-004).
- (5) Inspect igniter plug terminal well and tip erosion per Inspection/Check-03 (Task 72-00-41-210-003).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-03

Task 72-00-41-210-003:

1. Inspect Igniter Plug
   A. Prerequisites
      (1) Clean igniter plug per Cleaning-01, (Task 72-00-41-160-001).
   B. Equipment And Materials Required

Standard Tools:

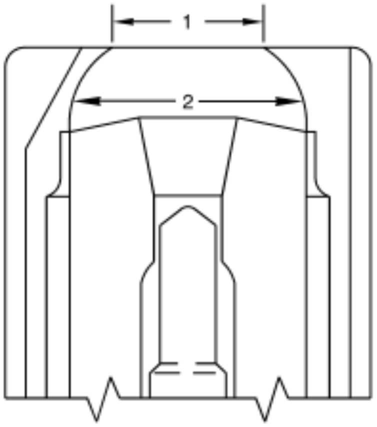
Name	Manufacturer
1.000-20NS Thread Chasing Die	Local Purchase
0.9375-16NS Thread Chasing Die	Local Purchase
Service Wear Measuring Tool CT-492 (or CT-468)	Local Purchase 900, Upton Toledo, OH 43801

   C. Procedure
      See Figures 801 and 802.
      (1) Visually inspect coupling threads and shell threads of igniter plug. Damaged threads can be cleaned-up using 1.000-20NS Thread Chasing Die for coupling threads and 0.9375-16NS Thread Chasing Die for shell threads.
      (2) Inspect ceramic for cracks on either end of plug. Any cracks in ceramic are cause for rejection of igniter plug. Internal ceramic breaks may be detected by shaking plug and listening for rattle.

CAUTION: WHEN PLUG IS EXCESSIVELY ERODED, BROKEN CERAMIC MAY BE INGESTED BY TURBINE.

      (3) Inspect plug for wear by using lighted magnifying glass looking through shell end annulus to determine if insulator supporting shoulder is worn through. Wear of Champion plugs may be measured using CT-492 (or CT-468) Service Wear Measuring Tool. See Figure 801.

NOTE: Visual determination of excessive wear is also a practical means of evaluating plug wear. Maximum outer shell ID erosion is a physical limit to prevent possible loss of ceramic retention by ground shell.



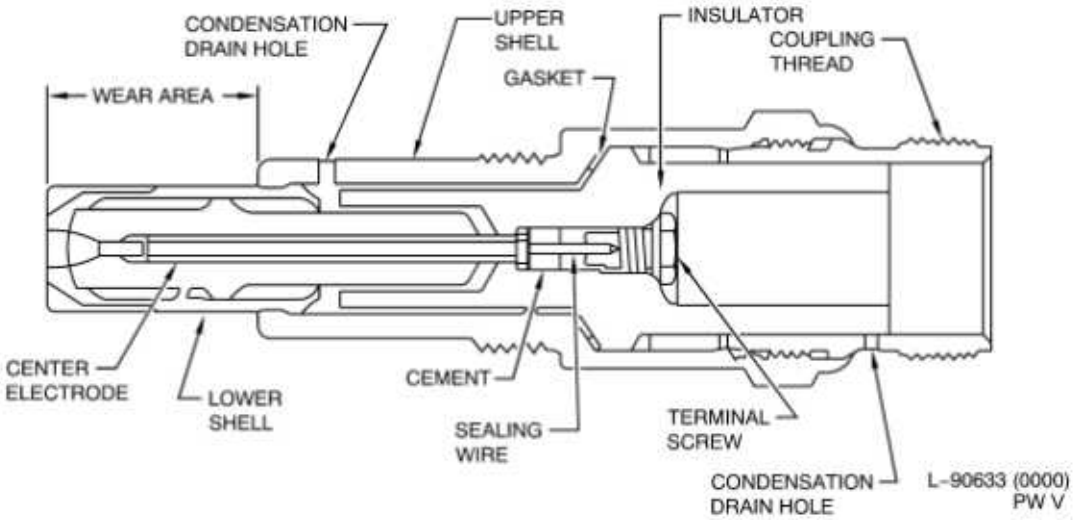
1. 0.300 Inch (7.620 mm) ID Maximum Outer Shell Erosion
2. 0.340 Inch (8.636 mm) ID Maximum Undercut Erosion

Igniter Plug Erosion
Figure 801
(Task 72−00−41−210−003)

(4) Inspect plugs for wear in area shown in Figure 802. Plugs worn beyond 0.030 inch (0.762 mm) depth in area shown shall be rejected.

NOTE: Igniter plug erosion is directly dependent upon ignition−on time. An igniter plug continuously firing will erode beyond acceptable limits in 250 − 300 hours. Installed igniter erosion life, as related to engine time, will therefore vary considerably between operators, dependent upon usage and flight length. Although igniters will continue to fire after exceeding erosion limits, the voltage required to achieve spark is increased to level that can stress other ignition components, particularly high tension leads.

(5) Whenever high tension lead is removed from igniter plug terminal, inspect plug terminal well. Inspection should consist of following:



CONDENSATION DRAIN HOLE
UPPER SHELL
INSULATOR
COUPLING THREAD
GASKET
WEAR AREA
CENTER ELECTRODE
LOWER SHELL
CEMENT
SEALING WIRE
TERMINAL SCREW
CONDENSATION DRAIN HOLE
L−90633 (0000)
PW V

Igniter Plug Wear Limit
Figure 802
(Task 72−00−41−210−003)

(a) Inspect plug terminal well for evidence of arcing and/or flashover. Arcing is identified by pitting or discoloration on contact button. See Figure 803. Minor arcing can be removed per Cleaning−01, (Task 72−00−41−160−001). Flashover is identified by carbon tracking. See Figure 804. If any of these indications are evident, replace plug.

(b) Inspect plug terminal well for presence of oil, dirt and conductive contaminants. Remove contamination per Cleaning−01, (Task 72−00−41−160−001).

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-04

Task 72-00-41-210-004:

1. Inspect Exciter-To-Igniter Plug Cable
   - A. Prerequisites
     - (1) Remove exciter-to-igniter plug cable. See Removal-04, (Task 72-00-41-050-001) or Removal-05 (Task 72-00-41-050-002).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figures 801 and 802.
     - (1) General
       - (a) Inspect conduit for cuts, abrasions, or other damage.
     - (2) Inspect high tension contact, sleeve, rubber bushing, and cable insulation. See Removal-04, (Task 72-00-41-050-001) or Removal-05 (Task 72-00-41-050-002).

       CAUTION: DO NOT BEND OR PULL HIGH TENSION CABLE. INSULATION WILL BE DAMAGED.

       - (a) During grommet replacement, inspect for evidence of arcing or flashover on high tension contact, sleeve, and rubber bushing. Arcing is identified by pitting and discoloration. Flashover is identified by carbon tracking. If major pitting of contact is evident, replace cable. Forward removed cable to appropriate facility for repair. See Figure 802. Minor discoloration and pitting of contact can be cleaned per Cleaning-02, (Task 72-00-41-160-002).
         - 1 If high tension sleeve shows carbon tracking, clean per Cleaning-02, (Task 72-00-41-160-002).
         - 2 If rubber bushing is hard, brittle, cracked, or shows evidence of carbon tracking, remove it. See Removal-04, (Task 72-00-41-050-001) or Removal-05 (Task 72-00-41-050-002). Inspect high tension cable insulation.
           - a If high tension cable insulation is hard, brittle, or cracked, replace cable. Forward removed cable to appropriate facility for repair.
           - b If high tension cable is serviceable, replace rubber bushing.
         - 3 Inspect for presence of oil, dirt, or conductive contaminants on exposed parts. Clean cable per Cleaning-02, (Task 72-00-41-160-002).
     - (3) Inspect cable following rapid shut down.

Flashover Damage
Figure 802
(Task 72−00−41−210−004)

(a) Whenever an engine is rapidly shut down, ignition system may not be sufficiently cooled. Inspect cables, particularly at igniter plug terminal, to ensure that excessive temperatures did not affect lead insulation or rubber bushings in a manner that may result in arcing, flashover, and carbon tracking.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-05

Task 72-00-41-210-005:

1. Inspect Fuel Distribution Valve Strainer
    - A. Prerequisites
        - (1) Remove fuel distribution valve strainer per Removal-10.
    - B. Equipment And Materials Required - None
    - C. Procedure
        - (1) Inspect strainer for evidence of damage or an accumulation of contamination.
        - (2) Clean strainer per Cleaning-03 or -04.
        - (3) In the presence of heavy contamination, inspect upstream filter element in fuel pump per 72-00-61, Inspection/Check-03.
    - D. Postrequisites
        - (1) Install fuel distribution valve strainer per Installation-10.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSPECTION/CHECK−06

Task 72−00−41−750−001:

1. Test Igniter Plug (Audible Check)
   - A. Equipment And Materials Required − None
   - B. Procedure

CAUTION: PRIOR TO AUDIBLE CHECK, MOTOR ENGINE IF UNBURNED FUEL IN ENGINE IS SUSPECTED. UNBURNED FUEL COULD RESULT IN AN INTERNAL ENGINE FIRE OR TAILPIPE FIRE.

DO NOT ALLOW ENGINE N2 ROTATION DURING IGNITER AUDIBLE CHECK. WITH N2 ROTATION, FUEL ENTRY INTO COMBUSTION CHAMBER IS POSSIBLE WHEN START LEVER IS ADVANCED TO IDLE AND INADVERTENT LIGHTUP DURING IGNITER CHECK COULD RESULT.

(1) Perform audible check of each igniter plug to confirm that plug is operating. Check each system individually by applying power to one side at a time.

NOTE: Audible check is not positive proof that igniter is functioning. Snapping sound may result from spark jumping in an area other than igniter tip.

(2) After audible check has been completed, position engine ignition switch to OFF position.

ENGINE GENERAL - DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-07

Task 72-00-41-720-001:

1. No. 3 Bearing Compartment Vacuum Check

A. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

CTE 6075	Vacuum Cart
PWA 85569	Adapter (Pre SB PW4ENG 72-127)
PWA 86136	Adapter (Post SB PW4ENG 72-127)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

B. Procedure

NOTE: No. 3 bearing compartment vacuum check must be performed following each diffuser and combustor installation.

NOTE: Vacuum check may be performed on engines without having diffuser and combustor replaced by disconnecting and subsequently re-connecting tubes as specified in the following text.

(1) If necessary, disconnect No. 3 bearing scavenge tube (LR04) as follows.

(a) Remove lockwire and disconnect nut securing scavenge from No. 3 bearing (internal) scavenge tube on diffuser case at approximately 6:30 o'clock position.

(b) Loosen bolts securing tube clamps as necessary.

(c) Loosen bolts securing tube to oil pump on gearbox as necessary.

(2) If necessary, disconnect No. 3 bearing oil pressure tube (LP19) as follows.

   (a) Remove lockwire and disconnect nut securing pressure tube to No. 3 bearing oil pressure (internal) tube on diffuser case at approximately 10 o'clock position.

   (b) Loosen bolts securing tube clamps as necessary.

   (c) Loosen nut securing strainer housing to (front) oil pressure tube.

(3) If necessary, disconnect No. 3 bearing breather tube (LB03) as follows.

   (a) Remove lockwire and disconnect nut securing breather tube to No. 3 bearing breather (internal) tube on diffuser case at approximately 1 o'clock position.

   (b) Loosen bolts securing tube clamps as necessary.

   (c) Loosen coupling nut securing tube to (lower) breather tube as necessary.

(4) Install plug MS24404-10, threads lubricated with Engine Oil P03-001, onto No. 3 bearing (internal) scavenge tube located at approximately 6:30 o'clock position. Torque plug to 200 lb-in. (22.597 N.m).

(5) Install cap PN AN929-8, threads lubricated with Engine Oil P03-001 onto oil pressure (internal) tube on diffuser case at approximately 10 o'clock position. Torque plug to 200 lb-in. (22.597 N.m).

(6) Install PWA 85569 Adapter (Pre SB PW4ENG 72-127) or PWA 86136 Adapter (Post SB PW4ENG 72-127), threads lubricated with Engine Oil P03-001 to No. 3 bearing breather (internal) tube on diffuser case at 1 o'clock position. Torque nut to 200 lb-in. (22.597 N.m). See Figure 801.

(7) Vacuum check No. 3 bearing compartment as follows.

   (a) Connect vacuum hose and pressure sense line from CTE 6075 Vacuum Cart to their respective threaded holes in Adapter (PWA 85569) or (PWA 86136).

(b) Vacuum check No. 3 bearing compartment with the vacuum cart pressure set at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute).

(c) Airflow must not exceed 15 lbs. (6.80 Kg) per hour.

(d) Shut off vacuum. Disconnect lines from adapter.

(8) Remove plug, cap and adapter from tubes located at 6:30, 10, and 1 o'clock positions respectively. Install protective closures.

(9) If previously disconnected to perform vacuum check, reconnect No. 3 bearing scavenge tube (LR04) as follows.

(a) Remove protective closure and lubricate threads on scavenge tube elbow with Engine Oil P03−001. Connect tube to No. 3 bearing (internal) scavenge tube at approximately 6 o'clock position. Tighten nut handtight only.

(b) Lubricate threads of bolt securing clamp. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Using Engine Oil P03−001, lubricate threads of bolts securing tube to port on main oil pump. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(d) Torque diffuser case internal tube nut to 650 − 700 lb−in. (73.440 − 79.089 N.m), while holding manifold elbow from turning. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(10) If previously disconnected to perform vacuum check, reconnect No. 3 bearing pressure tube (LP19) as follows.

(a) Remove protective closures and lubricate
R tube nut threads with Antiseize Paste P06−054.
Lubricate strainer housing coupling threads with
R Antiseize Paste P06−054. Wipe off unwanted
paste. Attach tube nut to diffuser case No. 3
bearing (internal) pressure tube at approximately
10 o'clock position. Tighten nuts securing tube
handtight only.

(b) Lubricate threads of previously loosened clamp bolts with Engine Oil P03−001. Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque tube nut attached to diffuser case internal tube coupling to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Torque manifold nut to strainer housing to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292. Position spray shield to inboard side of connection and secure to manifold with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(11) If previously disconnected to perform vacuum check, reconnect the (upper) No. 3 bearing breather tube (LB03) as follows.

(a) Remove protective closures and lubricate threads on breather tube elbow with Engine Oil P03−001. Connect tube to No. 3 bearing (internal) breather tube at approximately 1 o'clock position on diffuser case. Tighten nut handtight only.

(b) Tighten bolts, threads lubricated with Engine Oil P03−001, securing clamps. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque diffuser case internal tube nut to tube elbow to 650 − 700 lb−in. (73.440 − 79.089 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

R (d) Lubricate threads of tube coupling with Antiseize
R Paste P06−054. Wipe off unwanted paste. Torque tube nut to 675 − 750 lb−in. (76.265 − 84.739 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

ENGINE GENERAL − DIFFUSER AND COMBUSTOR − INSPECTION/CHECK−08

Task 72−00−41−210−008:

1. Visually Inspect Diffuser And Combustion Areas

   A. Equipment And Materials Required − None

   B. General Inspection Requiremnts

      (1) The following guidelines are provided for visual inspection to determine the serviceability of the diffuser and combustion areas which may be exposed during a partial engine disassembly.

      (2) Visually inspect the diffuser and combustion areas for obvious surface defects and/or deformations which will preclude the proper functioning of any of the parts. If defects are noted on any of the parts see the individual part section for damage limits.

      (3) Do a visual inspection of the combustion chamber liner segments, bulkhead liner segments and fuel injector guide heat shields for damaged or missing thermal barrier coating.

         (a) Any quantity of missing thermal barrier coating is permitted. However, the rate of deterioration of these parts will increase with higher levels of missing coating.

         (b) Cracks and damage in areas with missing thermal barrier coating must be within individual part section damage limits.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-41-210-010:

1. Visually Examine The Diffuser And Combustor Module Assembly - Engine General - Diffuser And Combustor

A. Equipment And Materials Necessary - None

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (ADs) must be complied with and these directives take precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero. The use of the limits in this inspection will not give the performance restoration.

(2) These procedures give instructions for the visual inspection of the diffuser and combustor module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. The purpose of these procedures is to find apparent types of damage, which can make it necessary to do more disassembly, inspection or repair.

(3) The inspection table in this section is applicable to the diffuser and combustor modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component.

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72-41-00 in the PW4000 Series CIR, PN 51A357. All components that you remove from the diffuser and combustor module, after the module removal from the engine, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

R (5) Unless given differently, closed areas without tolerance given in this section are to corners, points of tangency between the surfaces or at the points opposite to one of these locations. Closed areas will have a tolerance of plus 0.125 inch (3.175 mm) in all directions unless adjacent areas are given as areas where damage is not permitted.

R C. Procedure

R (1) Examine the diffuser case. See Table 801, Figure 801 (Sheet 1) and Figure 801 (Sheet 2).

R (2) Examine the diffuser case bosses. See Table 802, Figure 802 (Sheet 1) and Figure 802 (Sheet 2).

R (3) Examine the HPC exit stator assembly. See Table 803 and Figure 803.

R (4) Examine the Stage 5 HPC airsealing ring assembly and front HPC exit brush seal support assembly. See Table 804 and Figure 804.

R (5) Examine the No. 3 bearing housing. See Table 805 and Figure 805.

R (6) Examine the rear HPC exit brush seal support assembly or diffuser airsealing ring assembly. See Table 806, Figure 806 (Sheet 1) and Figure 806 (Sheet 2).

R (7) Examine the double-pass outer combustion chamber configuration. See Table 807, Figure 807 (Sheet 1) and Figure 807 (Sheet 2).

R (8) Examine the talon configuration outer combustion chamber. See Table 808, Figure 808 (Sheet 1) and Figure 808 (Sheet 2).

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
All diffuser case surfaces for: See Figure 801 (Sheet 1) and Figure 801 (Sheet 2)			
1 Nicks, dents and scratches (Inner wall only)	0.010 Inch (0.254 mm) maximum depth is permitted with no sharp edges or burrs. 0.500 inch (12.700 mm) maximum length. No damage in the fillet radii without repair.	0.020 inch (0.508 mm) maximum depth. See the repair for minimum wall thickness, fillet radius and flange repair limits.	Refer to Section 72−41−01, Repair−14 in the PW4000 Series CIR, PN 51A357
2 Nicks, dents and scratches (Outer wall only)	0.010 Inch (0.254 mm) maximum depth is permitted with no sharp edges or burrs. 0.500 inch (12.700 mm) maximum length. No damage in the fillet radii without repair.	Contact Pratt & Whitney for disposition	
1 and 2 Surface burns	Not permitted		

Diffuser Case Visual Inspection
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3 Crack indications on the rear outer flange (Other than boltholes)	0.016 inch (0.406 mm) maximum length is permitted with 0.240 inch (6.096 mm) minimum separation	See Repair-14 for blend limits or Repair-54 for weld repair	Refer to Section 72-41-01, Repair-14 or Repair-54 in the PW4000 Series CIR, PN 51A357
4 Crack indications on rear outer flange (Bolthole cracks)			
Extending radially out	Not permitted	See Repair-14 for blend limits or Repair-54 for weld repair	Refer to Section 72-41-01, Repair-14 or Repair-54 in the PW4000 Series CIR, PN 51A357
Extending radially in	Not permitted	See the repair	Refer to Section 72-41-01, Repair-37 in the PW4000 Series CIR, PN 51A357
5 For cracks	No cracks are permitted	0.020 inch (0.508 mm) maximum depth of blend to remove damage	Refer to Section 72-41-01, Repair-14 or Repair-30 in the PW4000 Series CIR, PN 51A357

Diffuser Case Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
6			
All inner diameter and outer diameter bolt flanges	Not permitted	0.008 inch (0.203 mm) maximum depth locally	Refer to Section 72-41-01, Repair-14 in the PW4000 Series CIR, PN 51A357
7			
Stage 1 HPT vane support mating diameter and slots for damage, wear and galling	0.010 inch (0.254 mm) maximum depth locally for full circumference. No raised material. The average mating diameter must be in limits. Refer to Section 72-41-01, Inspection/ Check-04 in the PW4000 Series CIR, PN 51A357 for dimensional inspection.	Raised material only	Refer to Section 72-41-01, Repair-14 in the PW4000 Series CIR, PN 51A357
Plasma coat on Stage 1 HPT vane support rear face	A maximum of 85 percent of total surface area can be missing	All quantities	Refer to Section 72-41-01, Repair-45 in the PW4000 Series CIR, PN 51A357

Diffuser Case Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
8 Stage 15 compressor stator mating diameter for damage, wear and galling	0.010 inch (0.254 mm) maximum depth locally for full circumference. No raised material. The average mating diameter must be in limits. Refer to Section 72−41−01, Inspection/ Check−04 in the PW4000 Series CIR, PN 51A357 for dimensional inspection.	Raised material only	Refer to Section 72−41−01, Repair−14 in the PW4000 Series CIR, PN 51A357
9 Locating pin for damage or looseness	Not permitted	All quantities	Replace the pin. Refer to Section 72−41−01, Repair−02 in the PW4000 Series CIR, PN 51A357.
10 Gangnut assemblies for damaged threads or looseness	Not permitted	All quantities	Replace the gangnut. Refer to Section 72−41−01, Repair−15 in the PW4000 Series CIR, PN 51A357

Diffuser Case Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
11 Strut leading edge for nicks, dents and scratches	Not permitted	0.080 inch (2.032 mm) maximum axial depth	Refer to Section 72−41−01, Repair−14 in the PW4000 Series CIR, PN 51A357
12 Strut airfoil surface for nicks, dents and scratches	Not permitted	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−41−01, Repair−14 in the PW4000 Series CIR, PN 51A357
13 Pre−diffuser clearance holes and strut surface for cracks	One crack 0.250 inch (6.350 mm) axial length maximum	All quantities for Repair−30 and Repair−31. 0.500 inch (12.700 mm) maximum length for Repair−51.	Refer to Section 72−41−01, Repair−30, Repair−31 and Repair−51 in the PW4000 Series CIR, PN 51A357

Diffuser Case Visual Inspection
Table 801 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Diffuser case outer diameter bosses for nicks, scratches, wear and galling in: See Figure 802 (Sheet 1)			
Area 1	Not permitted	0.008 inch (0.203 mm) locally with no raised material	Refer to Section 72-41-01, Repair-14 in the PW4000 Series CIR, PN 51A357
Area 2	Not permitted	0.020 inch (0.508 mm) maximum depth	Refer to Section 72-41-01, Repair-14 in the PW4000 Series CIR, PN 51A357
Area 3	Not permitted	0.015 inch (0.381 mm) maximum depth	Refer to Section 72-41-01, Repair-14 in the PW4000 Series CIR, PN 51A357
4 Large and small service boss helical inserts for damage or looseness	Not permitted	All quantities	Refer to Section 72-41-01, Repair-33 in the PW4000 Series CIR, PN 51A357

ENGINE GENERAL - TURBINE NOZZLE - REMOVAL-01

Task 72-00-51-020-001:

1. Remove Turbine Nozzle - Horizontal

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The High Pressure Turbine - Horizontal. Refer to 72-00-52, Removal-01 (Task 72-00-52-020-001).

B. Equipment And Materials Necessary

Standard Tools:
0.3125-24 Jackscrews (Four Necessary)

Special Tools:

PWA 28657	Sling, Handling
PWA 76154	Adapter (Two Necessary)
PWA 85063	Adapter, Wrench
PWA 85078	Fixture, Holding
PWA 85170	Pins, Aligning (Three Necessary)

C. Procedure
See Figure 302.

(1) Remove instrumentation plug (borescope) (302/3) and washer (302/2) from diffuser case (302/1) at 3 o'clock position as viewed from rear. See Figure 302.

(2) Install PWA 85078 Fixture to turbine nozzle. See Figure 303 and Figure 304.

(a) Connect hoist with PWA 28657 Sling and two PWA 76154 Adapters to trunnion spools of PWA 85078 Fixture.

(b) Using hoist, position fixture to rear flange of diffuser case (303/9). Retract four inner clamps (303/1), six outer clamps (303/5) and 12 bolts (303/7).

(c) Using PWA 85063 Wrench Adapter, remove bolts (303/1) underlying inner clamps of fixture.

(d) Seat fixture against 1st stage HPT support (303/4). Slide six clamps (303/5) over rear lip of support and tighten bolts (303/6) to secure clamps.

(e) Slide four clamps (303/1) over cooling duct flange (303/2).

(f) Using 12 bolts (303/7) seat pads (303/8) against rear flange of diffuser case (303/9).

(g) Take up slack in hoist.

(3) Using PWA 85063 Wrench Adapter remove bolts (303/1) securing lst stage HPT cooling duct (303/2) to diffuser case flange. See Figure 303.

(4) Install three PWA 85170 Aligning Pins into boltholes in 1st stage HPT cooling duct, and thread into inner rear flange of diffuser case.

(5) Install four 0.3125−24 Jackscrews into recessed jackscrew holes in front flange of cooling duct.

CAUTION: THE FOUR JACKSCREWS IN THE COOLING DUCT MUST BE TIGHTENED EVENLY IN CONJUNCTION WITH THE 12 BOLTS AND PAD ASSEMBLIES IN THE OUTER RING OF PWA 85078 FIXTURE OR DISTORTION OF OUTER RING MAY OCCUR.

(6) Evenly tighten 12 bolts (304/7) in outer ring of fixture and four jackscrews in cooling duct flange to separate turbine nozzle from diffuser case.

CAUTION: THE TURBINE NOZZLE MUST BE REMOVED FAR ENOUGH SO THAT THE COOLING DUCT SENSE TUBE IS FULLY DISENGAGED FROM THE COOLING DUCT BEFORE YOU ROTATE THE 1ST STAGE HPT COOLING DUCT.

(7) Move the turbine nozzle rearward far enough to disengage the turbine cooling duct sensing tube from the mating hole in the 1st stage HPT cooling duct. The turbine cooling duct sensing tube is located at the rear of the diffuser case at 15 degrees counterclockwise from TDC. Carefully rotate the assembly as required to provide clearance for the lugs of the combustion chamber clamp at 6 o'clock position on the turbine nozzle.

(8) Trunnion assembly to rear end down position and place assembly on pallet.

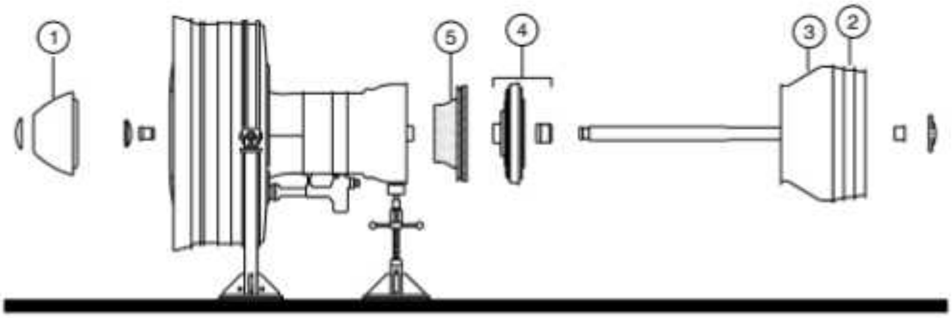
(9) Remove spring gasket (305/1) from upper OD groove in 1st stage HPT support (305/2). See Figure 305.

(10) Using hoist, lift and trunnion assembly to front, inner combustion chamber, end down position. Lower assembly onto pallet.

(11) Turbine nozzle, combustion chamber clamp and spacer, and diffuser outer combustion chamber are a matched set. If turbine nozzle will be disassembled or mated to reworked or different outer combustion chamber, remove nut (306/3), spacer (306/2) and bolt (306/1) securing combustion chamber clamp (306/4). Remove clamp from turbine nozzle. See Figure 306.

NOTE: Matched set was established during previous engine build by machining combustion chamber clamp spacer to specific dimensional requirement of mating outer combustion chamber, turbine nozzle and combustion chamber clamp.

ENGINE GENERAL − TURBINE NOZZLE − REMOVAL−01



1. REMOVE COMPRESSOR INLET CONE
2. REMOVE TURBINE EXHAUST CASE
3. REMOVE LOW PRESSURE TURBINE
4. REMOVE HIGH PRESSURE TURBINE
5. REMOVE TURBINE NOZZLE

ENGINE GENERAL - TURBINE NOZZLE - REMOVAL-02

Task 72-00-51-020-002:

1. Remove Turbine Nozzle - Vertical

NOTE: See Figure 301 for Part/Assembly Removal Procedure Sequence.

A. Prerequisites

(1) Remove The High Pressure Turbine - Vertical. Refer to 72-00-52, Removal-08 (Task 72-00-52-020-002).

B. Equipment And Materials Necessary

Standard Tools:
0.3125-24 Jackscrews (Four Required)

Special Tools:

PWA 28657 Sling, Handling
PWA 76154 Adapter (Two Required)
PWA 85063 Adapter, Wrench
PWA 85078 Fixture, Holding
PWA 85170 Pins, Aligning (Three Required)

C. Procedure
See Figure 302.

(1) Remove instrumentation plug (borescope) (302/1) and washer (302/2) from diffuser case (302/3) at 3 o'clock position as viewed from rear. See Figure 302.

(2) Using PWA 85063 Wrench Adapter remove 36 bolts (303/1) securing 1st stage HPT cooling duct (303/2) to diffuser case flange. See Figure 303.

(3) Install PWA 85078 Fixture to turbine nozzle. See Figure 304.

(a) Connect hoist with PWA 28657 Sling and two PWA 76154 Adapters to trunnion spools of Fixture PWA 85078.

(b) Using hoist, position fixture to diffuser case rear flange (304/9). Retract four inner clamps (304/1), six outer clamps (304/5) and 12 bolts (304/7).

(c) Seat fixture against 1st stage HPT support (304/4). Slide six clamps (304/5) over rear lip of support and tighten bolts (304/6) to secure clamps.

(d) Slide four clamps (304/1) over cooling duct flange (304/2).

(e) Using 12 bolts (304/7) seat pads (304/8) against rear flange of diffuser case (304/9).

(f) Take up slack in hoist.

(4) Install three PWA 85170 pins into boltholes in 1st stage HPT cooling duct, and thread into inner rear flange of diffuser case.

CAUTION: THE FOUR JACKSCREWS IN THE COOLING DUCT MUST BE TIGHTENED EVENLY IN CONJUNCTION WITH THE 12 BOLTS AND PAD ASSEMBLIES IN THE OUTER RING OF PWA 85078 FIXTURE OR DISTORTION OF OUTER RING MAY OCCUR.

(5) Install four 0.3125−24 Jackscrews into recessed jackscrew holes in front flange of cooling duct.

(6) Evenly tighten 12 bolts (304/7) in outer ring of fixture and four jackscrews in cooling duct flange to separate turbine nozzle from diffuser case.

CAUTION: THE TURBINE NOZZLE MUST BE REMOVED FAR ENOUGH SO THAT THE COOLING DUCT SENSE TUBE IS FULLY DISENGAGED FROM THE COOLING DUCT BEFORE YOU ROTATE THE 1ST STAGE HPT COOLING DUCT.

(7) Move the turbine nozzle rearward far enough to disengage the turbine cooling duct sensing tube from the mating hole in the 1st stage HPT cooling duct. The turbine cooling duct sensing tube is located at the rear of the diffuser case at 15 degrees counterclockwise from TDC. Carefully rotate the assembly as required to provide clearance for the lugs of the combustion chamber clamp at 6 o'clock position on the turbine nozzle.

(8) Using hoist, lift and trunnion assembly to rear end down position and place assembly on pallet.

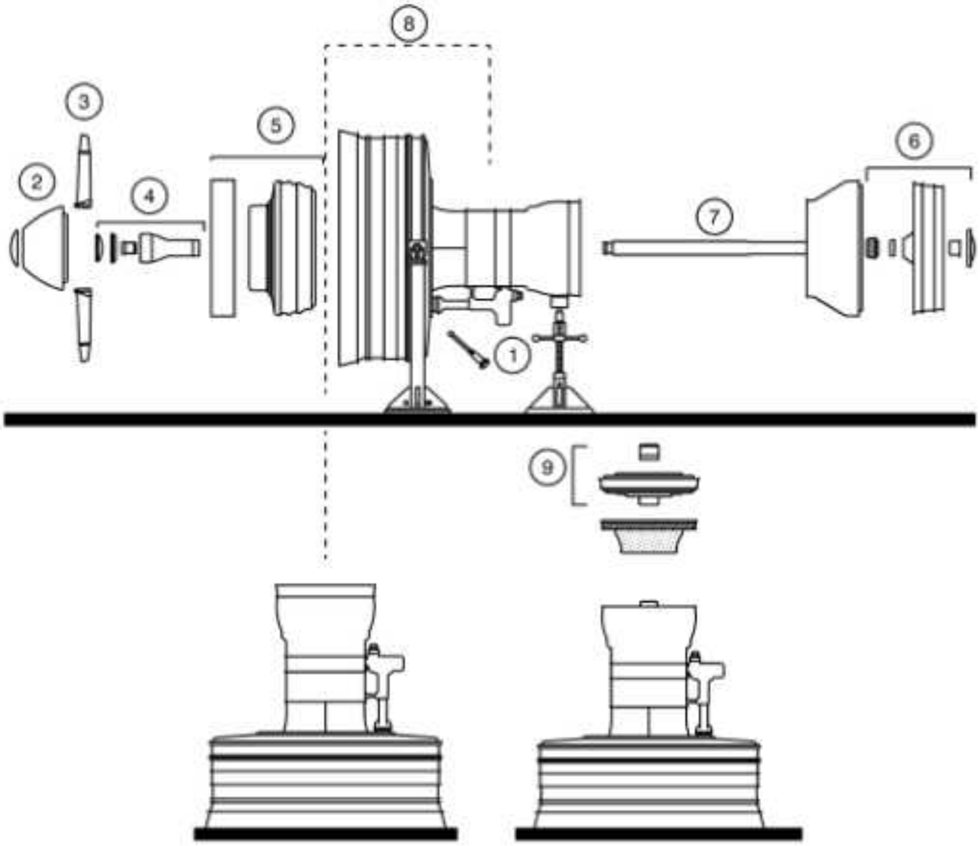
(9) Remove spring gasket (305/1) from upper OD groove in 1st stage HPT support (305/2). See Figure 305.

(10) Using hoist, lift and trunnion assembly to front, inner combustion chamber, end down position. Lower assembly onto pallet.

(11) Turbine nozzle, combustion chamber clamp and spacer, and diffuser outer combustion chamber are a matched set. If turbine nozzle will be disassembled or mated to reworked or different outer combustion chamber, remove nut (306/3), spacer (306/2) and bolt (306/1) securing combustion chamber clamp (306/4). Remove clamp from turbine nozzle. See Figure 306.

NOTE: Matched set was established during previous engine build by machining combustion chamber clamp spacer to specific dimensional requirement of mating outer combustion chamber, turbine nozzle and combustion chamber clamp.

ENGINE GENERAL − TURBINE NOZZLE − REMOVAL−02



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE TURBINE EXHAUST CASE.
7. REMOVE LOW PRESSURE TURBINE (LPT).
8. TRUNNION FAN CASES THROUGH HIGH PRESSURE TURBINE (HPT) TO FRONT END DOWN.
9. REMOVE HIGH PRESSURE TURBINE (HPT).

ENGINE GENERAL - TURBINE NOZZLE - INSTALLATION-01

Task 72-00-51-420-001:

1. Install Turbine Nozzle - Horizontal

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-00-51-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling, Handling
PWA 29754	Control
PWA 29855-2	Alignment Pins
PWA 76154	Adapter (Two Necessary)
PWA 85063	Adapter, Wrench
PWA 85078	Fixture, Holding
PWA 85170	Pin, Aligning (3 Necessary)
PWA 85644	Ring, Gaging
PWA 87139	Heater
PWA 87172	Ring, Retaining

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-102	Dry Ice
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
	P05-395	Beeswax
R	P05-396	Paraffin Wax Blend
	P06-023	Silver Goop (PWA 36001)
R	P06-054	Antiseize Paste (PWA 36246)

C. Procedure
See Figure 402.

CAUTION: ENGINES THAT HAVE AN OUTER COMBUSTION CHAMBER ASSEMBLY WITH REVISED DILUTION HOLES (DECREASED EMISSIONS) MUST BE USED IN SETS WITH INNER COMBUSTION CHAMBER ASSEMBLY WITH REVISED DILUTION HOLES (REFERENCED SB PW4ENG 72−187).

(1) Install PWA 85078 Fixture to turbine nozzle. See Figure 402.

(a) Connect hoist with PWA 28657 Sling and two PWA 76154 Adapters to trunnion spools of Fixture (PWA 85078).

(b) Retract four inner clamps (402/1), six outer clamps (402/5), and bolts (402/7). Remove ten bolt assemblies (402/8).

(c) Locate the borescope boss line on the fixture ring. Use the hoist to put the fixture over the turbine nozzle. Align the borescope boss line with the instrumentation guide (borescope) detail of the combustion chamber guide. Lower the fixture on the 1st stage HPT support (402/4). Slide the six clamps (402/5) over the rear lip of the support and tighten bolts (402/6) to secure the clamps.

(d) Slide the four clamps (402/1) over the flange of the 1st stage HPT cooling duct (402/3).

(2) Use the hoist to lift and trunnion the assembly to rear end down position and rest it on the feet of the fixture.

CAUTION: SHOULD ANY OF THE FITTED HARDWARE BE REPLACED PRIOR TO FINAL INSTALLATION, THIS PROCEDURE MUST BE PERFORMED AGAIN AND A NEW CLAMP SPACER MAY BE REQUIRED.

(3) (Reference 1000) (Engines Without The Talon II Low Emmision Burner) Determine combustion chamber clamp spacer thickness. See Figure 403 (Sheet 1).

NOTE: You can use a gage ring or the actual combustion chamber assembly to determine the spacer thickness in the following procedure.

(a) If you use PWA 85644 Gaging Ring, measure largest outside diameter at rear of outer combustion chamber. Set the gaging ring to this diameter.

(b) Loosen combustion chamber guide nuts (403/1) one full turn.

(c) If applicable, position gaging ring into combustion chamber guides.

CAUTION: IF YOU USE THE ACTUAL COMBUSTION CHAMBER, USE CARE THAT YOU DO NOT DAMAGE THE PROTECTIVE COATING ON THE COMBUSTION CHAMBER LINER.

(d) If you use the actual outer combustion chamber assembly, use a hoist and suitable sling to put the combustion chamber into the combustion chamber guides.

(e) Install combustion chamber clamp (403/6) around guides and secure with detail bolt (403/2) and 0.250-28 UNJF-3B non-self-locking worknut (403/7). Place clamp split at the 6 o'clock location. Torque bolt to 6 - 10 lb-in. (0.678 - 1.130 N.m).

(f) Measure Gap K between two ends of combustion chamber clamp.

(g) (Pre SB PW4ENG 72-702) Machine the spacer (403/3) to a width of 0.005 - 0.015 inch (0.13 - 0.38 mm) less than Gap K.

(h) (Post SB PW4ENG 72-702) Select the correct class spacer (403/3) to get a width of 0.005 - 0.015 inch (0.13 - 0.38 mm) less than Gap K. See Table 401. If necessary, machine the spacer to get the correct fit.

CLASS	SPACER THICKNESS
CL1	0.105 - 0.111 inch (2.667 - 2.819 mm)
CL2	0.115 - 0.121 inch (2.921 - 3.073 mm)
CL3	0.125 - 0.131 inch (3.175 - 3.327 mm)
CL4	0.135 - 0.141 inch (3.429 - 3.581 mm)
CL5	0.145 - 0.151 inch (3.683 - 3.835 mm)
CL6	0.155 - 0.161 inch (3.937 - 4.089 mm)
CL7	0.165 - 0.171 inch (4.191 - 4.343 mm)
CL8	0.175 - 0.181 inch (4.445 - 4.597 mm)

Table 401

R
R

(CONTINUED)

CLASS	SPACER THICKNESS
CL9	0.185 - 0.191 inch (4.699 - 4.851 mm)
CL10	0.195 - 0.201 inch (4.953 - 5.105 mm)
CL11	0.205 - 0.211 inch (5.207 - 5.359 mm)
CL12	0.215 - 0.221 inch (5.461 - 5.613 mm)
CL13	0.225 - 0.231 inch (5.715 - 5.867 mm)
CL14	0.235 - 0.241 inch (5.969 - 6.121 mm)
CL15	0.245 - 0.251 inch (6.223 - 6.375 mm)
CL16	0.065 - 0.071 inch (1.651 - 1.803 mm)
CL17	0.075 - 0.081 inch (1.905 - 2.057 mm)
CL18	0.085 - 0.091 inch (2.159 - 2.311 mm)
CL19	0.095 - 0.101 inch (2.413 - 2.565 mm)

Table 401 (Continued)

(i) (Pre SB PW4ENG 72-542) As necessary, apply
R Antiseize Paste P06-054 to the threads of the
R bolts before you install the nuts (403/1). Wipe
R off unwanted paste. Torque the nuts (403/1) to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(j) (Post SB PW4ENG 72-542) Torque the nuts (403/1) to 85 - 95 lb-in. (9.604 - 10.734 N.m). As necessary, apply Engine Oil P03-001 to threads of the nuts before you apply the torque.

(k) Loosen bolt detail and remove gaging ring or the actual combustion chamber if applicable, from combustion chamber guides.

(l) Disassemble bolt (403/2) and nut (403/7) from clamp.

(m) Reassemble bolt (403/2), spacer (403/3) and self-locking nut (403/4). Place clamp split at the 6 o'clock location. Torque bolt to 100 - 110 lb-in. (11.298 - 12.428 N.m).

CAUTION: IF ANY OF THE FITTED HARDWARE IS REPLACED BEFORE FINAL INSTALLATION, THEN YOU MUST DO THIS PROCEDURE AGAIN. IT IS POSSIBLE YOU WILL NEED A NEW CLAMP.

(4) (Reference 1015) (Engines With The Talon II Low Emmision Burner) Find the combustion chamber clamp spacer thickness. See Figure 403 (Sheet 2).

(a) Put the combustion chamber clamp on a work bench (the end with the slots down).

(b) Install a bolt (403/11) lubricated with Engine Oil P03−001 (with the head of the bolt to the right) and attach it with a work nut. Tighten the nut sufficiently to move the clamp assembly flanges together.

(c) Measure the ID of the clamp assembly with a PI Tape or other applicable device. Record this as Dimension C.

(d) Loosen the bolt (403/11) and the work nut. Put this bolt on a work bench for subsequent use.

(e) Measure the diameter of the outer burner at its largest OD with a PI Tape or other applicable device. Make sure you measure the middle section of the largest OD. Attach the PI Tape with tape. Record this as Dimension D. This dimension must be 36.638 − 36.658 inches (930.61 − 931.11 mm).

(f) Use the formula which follows to find the value for Dimension E:

E = [PI (3.1416 inches (79.797 mm)) x (D − C)] − 0.009 inch (0.229 mm).

(g) Record the value for Dimension E.

NOTE: You will use Dimension E to get the correct class of spacer (403/12) to use for the combustion chamber clamp (403/14).

(h) Get the class of spacer (403/12) that has a value nearest the value of Dimension E you calculated. Use the table below. If Dimension E is exactly between the spacer classes, use the lower class spacer:

CLASS	DIMENSION E (SPACER THICKNESS)
CL1	0.105 − 0.111 inch (2.667 − 2.819 mm)
CL2	0.115 − 0.121 inch (2.921 − 3.073 mm)
CL3	0.125 − 0.131 inch (3.175 − 3.327 mm)
CL4	0.135 − 0.141 inch (3.429 − 3.581 mm)
CL5	0.145 − 0.151 inch (3.683 − 3.835 mm)
CL6	0.155 − 0.161 inch (3.937 − 4.089 mm)

CLASS DIMENSION E (SPACER THICKNESS)

(CONTINUED)

CL7	0.165 − 0.171 inch (4.191 − 4.343 mm)
CL8	0.175 − 0.181 inch (4.445 − 4.597 mm)
CL9	0.185 − 0.191 inch (4.699 − 4.851 mm)
CL10	0.195 − 0.201 inch (4.953 − 5.105 mm)
CL11	0.205 − 0.211 inch (5.207 − 5.359 mm)
CL12	0.215 − 0.221 inch (5.461 − 5.613 mm)
CL13	0.225 − 0.231 inch (5.715 − 5.867 mm)
CL14	0.235 − 0.241 inch (5.969 − 6.121 mm)
CL15	0.245 − 0.251 inch (6.223 − 6.375 mm)

(i) Install the spacer (403/12) between the ends of the clamp assembly and attach it with the nut (403/13) and bolt (403/11) you used before.

(j) Tighten and torque the nut to 85 − 95 lb−in (9.604 − 10.734 N.m).

(k) Torque the nuts (403/10) to 85 − 95 lb−in. (9.604 − 10.734 N.m). As necessary, apply Engine Oil P03−001 to threads of the nuts before you apply the torque.

(5) Install spring gasket (404/1) in upper OD groove in 1st stage HPT support (404/2). Retain gasket in position using Beeswax P05−395 or Paraffin Wax Blend P05−396, as required. See Figure 404.

(6) Thread three PWA 85170 Aligning Pins into equally spaced boltholes in inner rear flange of diffuser case.

(7) Using hoist, lift assembly and trunnion to horizontal, flight, position.

CAUTION: YOU CAN DAMAGE THE TURBINE COOLING DUCT SENSING TUBE IF IT IS NOT ALIGNED WITH ITS MATING HOLE IN THE 1ST STAGE HPT COOLING DUCT.

(8) Locate the turbine cooling duct sensing tube (405/6) at the rear of the diffuser case at 15 degrees counterclockwise from TDC. Align the sensing tube with the mating hole in the 1st stage HPT cooling duct, and the boltholes with the aligning pins. Move the

assembly forward until it is stopped by the tight fit with the diffuser case. See Figure 405.

NOTE: Rear flange of turbine nozzle may be chilled to facilitate assembly.

CAUTION: MAKE SURE THAT THE INNER COMBUSTION CHAMBER ASSEMBLY (LINER) IS PROPERLY ENGAGED IN THE OUTER COMBUSTION CHAMBER (BULKHEAD) OR MISASSEMBLY OF PARTS CAN OCCUR.

(9) Use a flashlight or equivalent light source to check the engagement of the forward end of the inner combustion chamber assembly (liner) (405/2) in the outer combustion chamber (bulkhead) (405/1). Look between the Stage 1 HPT vanes (405/5) to check the engagement of the parts at the slip joint (405/3) all around. See Figure 405.

(10) Install ten bolt assemblies (406/7) through boltholes in rear flange of diffuser case (406/9) and boltholes in outer ring of Fixture (PWA 85078). Secure the bolts with nuts (406/8). See Figure 406.

(11) Evenly tighten ten nuts (406/8) to seat 1st stage HPT support in diffuser case.

(12) Secure inner flange of 1st stage HPT cooling duct (407/2) to diffuser case with several bolts (407/1) lubricated with Engine Oil P03−001. See Figure 407.

(13) Do a check of the PS4I pressure tube, located at approximately the 11 o'clock position on the OD of the diffuser case, for blockage as follows.

  (a) Attach a connector to the PS4I pressure tube and apply air pressure at 20.0 PSIG (137.9 kPa) to the tube.

  (b) Make sure air passes through the tube. No blockage is permitted.

  (c) If no blockage is found, remove the air source and connector and continue build.

  (d) If blockage is noted, remove and reposition the 1st stage HPT cooling duct to clear the tube.

(14) Remove Fixture (PWA 85078) from the turbine nozzle.

(a) Remove the bolt assemblies (406/7) and nuts (406/8) from the rear flange of diffuser case (406/9).

(b) Loosen the hand knobs (406/3) and retract four clamps (406/1) that hold the fixture to the cooling duct flange (406/2).

(c) Loosen the bolts and retract six clamps (406/5) that hold the fixture to the 1st stage HPT support (406/4).

(d) Use the hoist to remove the fixture from the turbine nozzle.

(15) Removing aligning pins as required, install remaining bolts (407/1), lubricated with Engine Oil P03-001, through boltholes in cooling duct and into diffuser case. Using PWA 85063 Wrench Adapter, torque 36 bolts to 290 - 325 lb-in. (32.766 - 36.720 N.m).

NOTE: If required, aligning pins may be removed using standard 0.250 inch (6.350 mm) universal socket.

(16) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the Stage 1 HPT brush seal and support assembly into the 1st stage HPT cooling duct assembly. See Figure 408.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
In the following step, replace the Stage 1 HPT brush seal assembly with a new assembly as follows:

1 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
If the 1st stage HPT inner airseal is replaced with a new or refurbished part.

2 FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
If the 1st stage HPT inner airseal was removed and re-installed on the 1st stage turbine hub regardless of the reason for the removal and re-installation.

NOTE: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
The 1st stage HPT inner airseal is installed in 72-52-01, Assembly-01 (Task 72-52-01-440-001).

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When the match of the 1st stage HPT inner airseal and brush seal is changed. Such as in a module swap.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the stage 1 HPT brush seal and support assembly on the bench, with the brush seal assembly up.

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
WHEN YOU INSTALL THE RETAINING RING IN THE BRUSH SEAL YOU MUST TURN THE RETAINING RING IN A CLOCKWISE DIRECTION OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the PWA 87172 Retaining Ring (small OD down) in the brush seal. Turn the Retaining Ring clockwise and push down until the flange of the ring touches the brush seal support.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the stage 1 brush seal and support assembly and the Retaining Ring in a container with Dry Ice P05−102.

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach three PWA 29855−2 Alignment Pins equally spaced through the duct flange that will be heated.

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the PWA 87139 Heater onto the duct and over the alignment pins. Use the hanger detail to hold the heater on the duct. The reflector assembly flange will rest on the top of the duct. Attach the PWA 29754 Control to the receptacle and the thermocouple.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Actuate the control to heat the duct to 200°F (93.3°C) minimum to 240°F (115.6°C) maximum.

(h) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Lubricate the threads of the 24 bolts with Engine Oil P03−001.

(i) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When the 1st stage HPT cooling duct assembly has the correct temperature, continue as follows.

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Wear gloves and remove the thermocouple connector from the heater control. Remove the heater control from the heater. Remove the heater from the cooling duct.

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the stage 1 HPT brush seal and support assembly and the Retaining Ring from the dry ice container.

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
WHEN YOU INSTALL THE ASSEMBLED BRUSH SEAL AND RETAINING RING, TURN THE RETAINING RING AND BRUSH SEAL IN A CLOCKWISE DIRECTION AS YOU INSTALL IT ON THE DUCT OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the assembled brush seal and retaining ring to the cooling duct. Turn the brush seal and the retaining ring in a clockwise direction on the cooling duct and align the bolt holes.

4 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach the brush seal to the cooling duct with the 12 bolts, every other bolt hole, and tighten the bolts to touch the brush seal support to the cooling duct, do not use more 85 − 95 lb−in. (9.604 − 10.734 N.m) of torque.

5 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Allow time for the brush seal and the cooling duct to get to room temperature.

(j) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Loosen the 12 bolts that attach the brush seal to the cooling duct to 0 lb−in. (0 N.m).

(k) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the 12 bolts in the remaining bolt holes to attach the brush seal to the cooling duct.

(l) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Torque the 24 bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

CAUTION: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 WHEN YOU REMOVE THE RETAINING RING FROM THE ASSEMBLED BRUSH SEAL AND COOLING DUCT, TURN THE RETAINING RING IN A CLOCKWISE DIRECTION OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

(m) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Turn the Retaining Ring (PWA 87172) in a clockwise direction and rearward to remove the retaining ring from the brush seal.

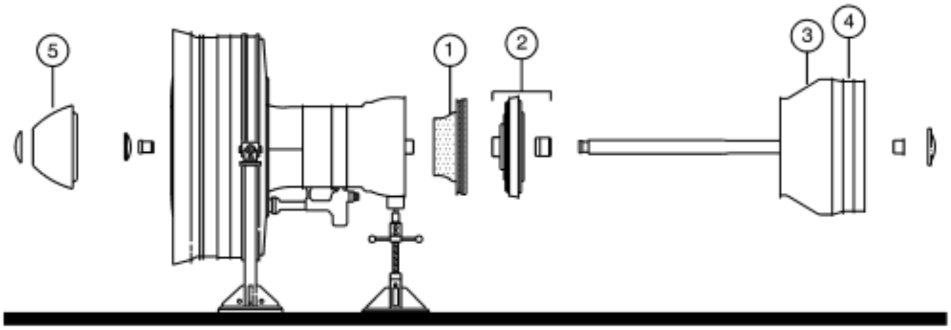
(17) Install washer (409/2) and instrumentation plug (borescope) (409/3), lubricated with Silver Goop P06-023, into the instrumentation port in the diffuser case (409/1) at 3 o'clock position. Torque the plug to 40 - 50 lb-in. (4.519 - 5.649 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the plug. See Figure 409.

D. Postrequisites

(1) Install The High Pressure Turbine - Horizontal. Refer to 72-00-52, Installation-01 (Task 72-00-52-420-001).

(2) Test the engine per the Repair Test Reference Table. Refer to 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − TURBINE NOZZLE − INSTALLATION−01



1. INSTALL TURBINE NOZZLE
2. INSTALL HIGH PRESSURE TURBINE
3. INSTALL LOW PRESSURE TURBINE
4. INSTALL TURBINE EXHAUST CASE

ENGINE GENERAL − TURBINE NOZZLE − INSTALLATION−02

Task 72−00−51−420−002:

1. Install Turbine Nozzle − Vertical

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check−01 Task 72−00−51−990−001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 28657	Sling, Handling
PWA 29754	Control
PWA 29855−2	Alignment Pins
PWA 76154	Adapter (Two Necessary)
PWA 85063	Adapter, Wrench
PWA 85078	Fixture, Holding
PWA 85170	Pin, Aligning (3 Necessary)
PWA 85644	Ring, Gaging
PWA 87139	Heater
PWA 87172	Ring, Retaining

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−102	Dry Ice
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
	P05−395	Beeswax
R	P05−396	Paraffin Wax Blend
	P06−023	Silver Goop (PWA 36001)
R	P06−054	Antiseize Paste (PWA 36246)

C. Procedure
See Figure 402.

CAUTION: ENGINES THAT HAVE AN OUTER COMBUSTION CHAMBER ASSEMBLY WITH REVISED DILUTION HOLES (DECREASED EMISSIONS) MUST BE USED IN SETS WITH INNER COMBUSTION CHAMBER ASSEMBLY WITH REVISED DILUTION HOLES (REFERENCED SB PW4ENG 72-187).

(1) Install PWA 85078 Fixture to turbine nozzle. See Figure 402.

(a) Connect hoist with PWA 28657 Sling and two PWA 76154 Adapters to trunnion spools of Fixture (PWA 85078).

(b) Retract four inner clamps (402/1), six outer clamps (402/5), and ten bolts (402/7). Remove ten bolt assemblies (402/8).

(c) Locate the borescope boss line on the fixture ring. Use the hoist to put the fixture over the turbine nozzle. Align the borescope boss line with the instrumentation guide (borescope) detail of the combustion chamber guide. Lower the fixture on the 1st stage HPT support (402/4). Slide the six clamps (402/5) over the rear lip of the support and tighten bolts (402/6) to secure the clamps.

(d) Slide the four clamps (402/1) over the flange of the 1st stage HPT cooling duct (402/3).

(2) Use the hoist to lift and trunnion the assembly to rear end down position and rest it on the feet of the fixture.

CAUTION: SHOULD ANY OF THE FITTED HARDWARE BE REPLACED PRIOR TO FINAL INSTALLATION, THIS PROCEDURE MUST BE PERFORMED AGAIN AND A NEW CLAMP SPACER MAY BE REQUIRED.

(3) (Reference 1000) (Engines Without The Talon II Low Emmision Burner) Determine combustion chamber clamp spacer thickness. See Figure 403 (Sheet 1).

NOTE: You can use a gage ring or the actual combustion chamber assembly to determine the spacer thickness in the following procedure.

(a) If you use PWA 85644 Gaging Ring, measure largest outside diameter at rear of outer combustion chamber. Set the gaging ring to this diameter.

(b) Loosen combustion chamber guide nuts (403/1) one full turn.

(c) If applicable, position gaging ring into combustion guides.

CAUTION: IF YOU USE THE ACTUAL COMBUSTION CHAMBER, USE CARE THAT YOU DO NOT DAMAGE THE PROTECTIVE COATING ON THE COMBUSTION CHAMBER LINER.

(d) If you use the actual outer combustion chamber assembly, use a hoist and suitable sling to put the combustion chamber into the combustion chamber guides.

(e) Install combustion chamber clamp (403/6) around guides and secure with detail bolt (403/2) and 0.250-28 UNJF-3B non-self-locking worknut (403/7). Place clamp split at the 6 o'clock location. Torque bolt to 6 - 10 lb-in. (0.678 - 1.130 N.m).

(f) Measure Gap K between two ends of combustion chamber clamp.

(g) (Pre SB PW4ENG 72-702) Machine the spacer (403/3) to a width of 0.005 - 0.015 inch (0.13 - 0.38 mm) less than Gap K.

(h) (Post SB PW4ENG 72-702) Select the correct class spacer (403/3) to get a width of 0.005 - 0.015 inch (0.13 - 0.38 mm) less than Gap K. See Table 401. If necessary, machine the spacer to get the correct fit.

CLASS	SPACER THICKNESS
CL1	0.105 - 0.111 inch (2.667 - 2.819 mm)
CL2	0.115 - 0.121 inch (2.921 - 3.073 mm)
CL3	0.125 - 0.131 inch (3.175 - 3.327 mm)
CL4	0.135 - 0.141 inch (3.429 - 3.581 mm)
CL5	0.145 - 0.151 inch (3.683 - 3.835 mm)
CL6	0.155 - 0.161 inch (3.937 - 4.089 mm)
CL7	0.165 - 0.171 inch (4.191 - 4.343 mm)
CL8	0.175 - 0.181 inch (4.445 - 4.597 mm)

Table 401

R
R

(CONTINUED)

CLASS	SPACER THICKNESS
CL9	0.185 - 0.191 inch (4.699 - 4.851 mm)
CL10	0.195 - 0.201 inch (4.953 - 5.105 mm)
CL11	0.205 - 0.211 inch (5.207 - 5.359 mm)
CL12	0.215 - 0.221 inch (5.461 - 5.613 mm)
CL13	0.225 - 0.231 inch (5.715 - 5.867 mm)
CL14	0.235 - 0.241 inch (5.969 - 6.121 mm)
CL15	0.245 - 0.251 inch (6.223 - 6.375 mm)
CL16	0.065 - 0.071 inch (1.651 - 1.803 mm)
CL17	0.075 - 0.081 inch (1.905 - 2.057 mm)
CL18	0.085 - 0.091 inch (2.159 - 2.311 mm)
CL19	0.095 - 0.101 inch (2.413 - 2.565 mm)

Table 401 (Continued)

(i) (Pre SB PW4ENG 72-542) As necessary, apply
R Antiseize Paste P06-054 to the threads of the
R bolts before you install the nuts (403/1). Wipe
R off unwanted paste. Torque the nuts (403/1) to 62
- 72 lb-in. (7.005 - 8.135 N.m).

(j) (Post SB PW4ENG 72-542) Torque the nuts (403/1) to 85 - 95 lb-in. (9.604 - 10.734 N.m). As necessary, apply Engine Oil P03-001 to threads of the nuts before you apply the torque.

(k) Loosen bolt detail and remove gaging ring or the actual combustion chamber if applicable, from combustion chamber guides.

(l) Disassemble bolt (403/2) and nut (403/7) from clamp.

(m) Reassemble bolt (403/2), spacer (403/3) and self-locking nut (403/4). Place clamp split at the 6 o'clock location. Torque bolt to 100 - 110 lb-in. (11.298 - 12.428 N.m).

CAUTION: IF ANY OF THE FITTED HARDWARE IS REPLACED BEFORE FINAL INSTALLATION, THEN YOU MUST DO THIS PROCEDURE AGAIN. IT IS POSSIBLE YOU WILL NEED A NEW CLAMP.

(4) (Reference 1015) (Engines With The Talon II Low Emmision Burner) Find the combustion chamber clamp spacer thickness. See Figure 403 (Sheet 2).

(a) Put the combustion chamber clamp on a work bench (the end with the slots down).

(b) Install a bolt (403/11) lubricated with Engine Oil P03−001 (with the head of the bolt to the right) and attach it with a work nut. Tighten the nut sufficiently to move the clamp assembly flanges together.

(c) Measure the ID of the clamp assembly with a PI Tape or other applicable device. Record this as Dimension C.

(d) Loosen the bolt (403/11) and the work nut. Put this bolt on a work bench for subsequent use.

(e) Measure the diameter of the outer burner at its largest OD with a PI Tape or other applicable device. Make sure you measure the middle section of the largest OD. Attach the PI Tape with tape. Record this as Dimension D. This dimension must be 36.638 − 36.658 inches (930.61 − 931.11 mm).

(f) Use the formula which follows to find the value for Dimension E:

E = [PI (3.1416 inches (79.797 mm)) x (D − C)]
− 0.009 inch (0.229 mm).

(g) Record the value for Dimension E.

NOTE: You will use Dimension E to get the correct class of spacer (403/12) to use for the combustion chamber clamp (403/14).

(h) Get the class of spacer (403/12) that has a value nearest the value of Dimension E you calculated. Use the table below. If Dimension E is exactly between the spacer classes, use the lower class spacer:

CLASS	DIMENSION E (SPACER THICKNESS)
CL1	0.105 − 0.111 inch (2.667 − 2.819 mm)
CL2	0.115 − 0.121 inch (2.921 − 3.073 mm)
CL3	0.125 − 0.131 inch (3.175 − 3.327 mm)
CL4	0.135 − 0.141 inch (3.429 − 3.581 mm)
CL5	0.145 − 0.151 inch (3.683 − 3.835 mm)
CL6	0.155 − 0.161 inch (3.937 − 4.089 mm)

CLASS DIMENSION E (SPACER THICKNESS)

(CONTINUED)

CL7	0.165 − 0.171 inch (4.191 − 4.343 mm)
CL8	0.175 − 0.181 inch (4.445 − 4.597 mm)
CL9	0.185 − 0.191 inch (4.699 − 4.851 mm)
CL10	0.195 − 0.201 inch (4.953 − 5.105 mm)
CL11	0.205 − 0.211 inch (5.207 − 5.359 mm)
CL12	0.215 − 0.221 inch (5.461 − 5.613 mm)
CL13	0.225 − 0.231 inch (5.715 − 5.867 mm)
CL14	0.235 − 0.241 inch (5.969 − 6.121 mm)
CL15	0.245 − 0.251 inch (6.223 − 6.375 mm)

(i) Install the spacer (403/12) between the ends of the clamp assembly and attach it with the nut (403/13) and bolt (403/11) you used before.

(j) Tighten and torque the nut to 85 − 95 lb−in (9.604 − 10.734 N.m).

(k) Torque the nuts (403/10) to 85 − 95 lb−in. (9.604 − 10.734 N.m). As necessary, apply Engine Oil P03−001 to threads of the nuts before you apply the torque.

(5) Install spring gasket (404/1) in upper OD groove in 1st stage HPT support (404/2). Retain gasket in position using Beeswax P05−395 or Paraffin Wax Blend P05−396, as required. See Figure 404.

(6) Thread three PWA 85170 Aligning Pins into equally spaced boltholes in inner rear flange of diffuser case.

(7) Using hoist, lift assembly and trunnion to front end down position.

CAUTION: YOU CAN DAMAGE THE TURBINE COOLING DUCT SENSING TUBE IF IT IS NOT ALIGNED WITH ITS MATING HOLE IN THE 1ST STAGE HPT COOLING DUCT.

(8) Locate the turbine cooling duct sensing tube (405/6) at the rear of the diffuser case at 15 degrees counterclockwise from TDC. Align the sensing tube with the mating hole in the 1st stage HPT cooling duct, and the boltholes with the aligning pins. Move the

assembly forward until it is stopped by the tight fit with the diffuser case. See Figure 405.

NOTE: Rear flange of turbine nozzle may be chilled to facilitate assembly.

CAUTION: MAKE SURE THAT THE INNER COMBUSTION CHAMBER ASSEMBLY (LINER) IS PROPERLY ENGAGED IN THE OUTER COMBUSTION CHAMBER (BULKHEAD) OR MIS−ASSEMBLY OF PARTS CAN OCCUR.

(9) Use a flashlight or equivalent light source to check the engagement of the forward end of the inner combustion chamber assembly (liner) (405/2) in the outer combustion chamber (bulkhead) (405/1). Look between the Stage 1 HPT vanes (405/5) to check the engagement of the parts at the slip joint (405/3) all around. See Figure 405.

(10) Install ten bolt assemblies (406/7) through boltholes in rear flange of diffuser case (406/9) and boltholes in outer ring of Fixture (PWA 85078). Secure the bolts with nuts (406/8). See Figure 406.

(11) Evenly tighten ten nuts (406/8) to seat 1st stage HPT support in diffuser case.

(12) Secure inner flange of 1st stage HPT cooling duct (407/2) to diffuser case with several bolts (407/1) lubricated with Engine Oil P03−001. See Figure 407.

(13) Do a check of the PS4I pressure tube, located at approximately the 11 o'clock position on the OD of the diffuser case, for blockage as follows.

(a) Attach a connector to the PS4I pressure tube and apply air pressure at 20.0 PSIG (137.9 kPa) to the tube.

(b) Make sure air passes through the tube. No blockage is permitted.

(c) If no blockage is found, remove the air source and connector and continue build.

(d) If blockage is noted, remove and reposition the 1st stage HPT cooling duct to clear the tube.

(14) Remove Fixture (PWA 85078) from the turbine nozzle.

(a) Remove the bolt assemblies (406/7) and nuts (406/8) from the rear flange of diffuser case (406/9).

(b) Loosen the hand knobs (406/3) and retract four clamps (406/1) that hold the fixture to the cooling duct flange (406/2).

(c) Loosen the bolts and retract six clamps (406/5) that hold the fixture to the 1st stage HPT support (406/4).

(d) Use the hoist to remove the fixture from the turbine nozzle.

(15) Removing aligning pins as required, install remaining bolts (407/1), lubricated with Engine Oil P03−001, through boltholes in cooling duct and into diffuser case. Using PWA 85063 Wrench Adapter, torque 36 bolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: If required, aligning pins may be removed using standard 0.250 inch (6.350 mm) universal socket.

(16) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the Stage 1 HPT brush seal and support assembly into the 1st stage HPT cooling duct assembly. See Figure 408.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
In the following step, replace the Stage 1 HPT brush seal (not the support) assembly with a new assembly as follows:

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
If the 1st stage HPT inner airseal is replaced with a new or refurbished part.

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
If the 1st stage HPT inner airseal was removed and re−installed on the 1st stage turbine hub regardless of the reason for the removal and re−installation.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
The 1st stage HPT inner airseal is installed in 72−52−01, Assembly−01 (Task 72−52−01−440−001).

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When the match of the 1st stage HPT inner airseal and brush seal is changed. Such as in a module swap.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the stage 1 HPT brush seal and support assembly on the bench, with the brush seal assembly up.

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
WHEN YOU INSTALL THE RETAINING RING IN THE BRUSH SEAL YOU MUST TURN THE RETAINING RING IN A CLOCKWISE DIRECTION OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the PWA 87172 Retaining Ring (small OD down) in the brush seal. Turn the Retaining Ring clockwise and push down until the flange of the ring touches the brush seal support.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the stage 1 brush seal and support assembly and the Retaining Ring in a container with Dry Ice P05−102.

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach three PWA 29855−2 Alignment Pins equally spaced through the duct flange that will be heated.

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the PWA 87139 Heater onto the duct and over the alignment pins. The reflector assembly flange will rest on the top of the duct. Attach the PWA 29754 Control to the receptacle and the thermocouple.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Actuate the control to heat the duct to 200°F (93.3°C) minimum to 240°F (115.6°C) maximum.

(h) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Lubricate the threads of the 24 bolts with Engine Oil P03−001.

(i) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When the 1st stage HPT cooling duct assembly has the correct temperature, continue as follows.

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Wear gloves and remove the thermocouple connector from the heater control. Remove the heater control from the heater. Remove the heater from the cooling duct.

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the stage 1 HPT brush seal and support assembly and the Retaining Ring from the dry ice container.

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
WHEN YOU INSTALL THE ASSEMBLED BRUSH SEAL AND RETAINING RING, TURN THE RETAINING RING AND BRUSH SEAL IN A CLOCKWISE DIRECTION AS YOU INSTALL IT ON THE DUCT OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the assembled brush seal and retaining ring to the cooling duct. Turn the brush seal and the retaining ring in a clockwise direction on the cooling duct and align the bolt holes.

4 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach the brush seal to the cooling duct with the 12 bolts, every other bolt hole, and tighten the bolts to touch the brush seal support to the cooling duct, do not use more 85 − 95 lb−in. (9.604 − 10.734 N.m) of torque.

5 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Allow time for the brush seal and the cooling duct to get to room temperature.

(j) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Loosen the 12 bolts that attach the brush seal to the cooling duct to 0 lb−in. (0 N.m).

(k) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the 12 bolts in the remaining bolt holes to attach the brush seal to the cooling duct.

(l) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque the 24 bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3 WHEN YOU REMOVE THE RETAINING RING FROM THE ASSEMBLED BRUSH SEAL AND COOLING DUCT, TURN THE RETAINING RING IN A CLOCKWISE DIRECTION OR DAMAGE CAN OCCUR TO THE BRUSH SEAL.

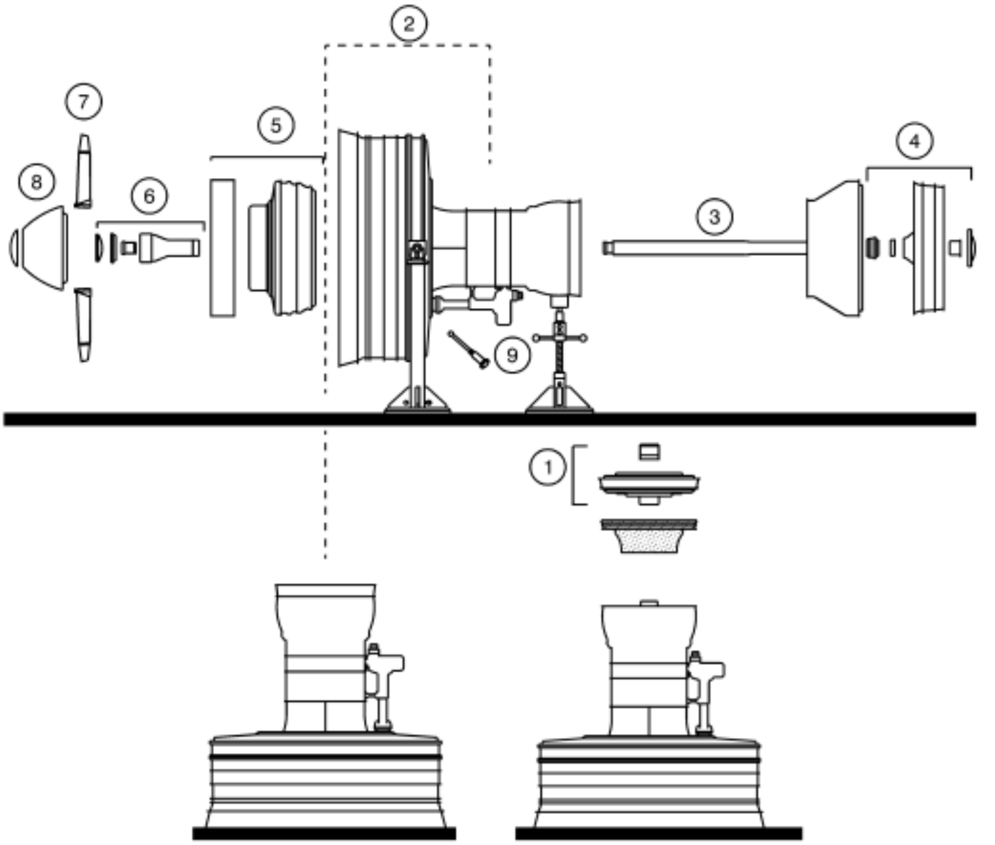
(m) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Turn the Retaining Ring (PWA 87172) in a clockwise direction and lift to remove the retaining ring from the brush seal.

(17) Install washer (409/2) and instrumentation plug (borescope) (409/1), lubricated with Silver Goop P06−023, into the instrumentation port in the diffuser case (409/3) at 3 o'clock position. Torque the plug to 40 − 50 lb−in. (4.519 − 4.649 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the plug. See Figure 409.

D. Postrequisites

(1) Install The High Pressure Turbine − Vertical. Refer to 72−00−52, Installation−08 (Task 72−00−52−420−002).

(2) Test the engine per the Repair Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).



1. INSTALL HIGH PRESSURE TURBINE (HPT).
2. TRUNNION FAN CASE THROUGH HIGH PRESSURE TURBINE (HPT) TO HORIZONTAL.
3. INSTALL LOW PRESSURE TURBINE (LPT).
4. INSTALL TURBINE EXHAUST CASE.
5. INSTALL LOW PRESSURE COMPRESSOR (LPC).
6. INSTALL LPC/LPT COUPLING.
7. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
8. INSTALL COMPRESSOR INLET CONE.
9. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL − TURBINE NOZZLE − INSPECTION/CHECK−01

Task 72-00−51−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max

ENGINE GENERAL - TURBINE NOZZLE - INSPECTION/CHECK-10

Task 72-00-51-210-010:

1. Visually Examine The Turbine Nozzle Module Assembly - Engine General - Turbine Nozzle

A. Equipment And Materials Necessary - None

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (AD's) must be complied with and these directives takes precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero. The use of the limits in this inspection will not give performance restoration.

(2) These procedures give instructions for the visual inspection of the turbine nozzle module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. Refer to Section 70-31-00 for the general visual inspection instructions in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the turbine nozzle modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component and do an inspection by step (4).

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72-51-00 in the PW4000 Series CIR, PN 51A357. Components that you remove from the turbine nozzle module, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

C. Procedure

R ENGINE GENERAL − TURBINE NOZZLE − INSPECTION/CHECK−10

R (1) Examine the Stage 1 vane ceramic coat. See Table 801,
R Figure 801 (Sheet 1) and Figure 801 (Sheet 2).

R (2) Examine the Stage 1 vane for crack. See Table 802,
R Figure 802 (Sheet 1), Figure 802 (Sheet 2), Figure 802
R (Sheet 3) and Figure 802 (Sheet 4).

R (3) Examine the vane outer diameter platform non−gaspath
R side. See Table 803 and Figure 803.

R (4) Examine the inner combustion liner for non−talon
R burners. See Table 804 and Figure 804.

R (5) Examine the inner combustion chamber for the low
R emission talon burner. See Table 805 and Figure 805.

R (6) Examine the cooling duct assembly (tObi). See Table
R 806 and Figure 806.

R (7) Examine the duct segments. See Table 807 and Figure
R 807.

R (8) Examine the Stage 1 vane support. See Table 808 and
R Figure 808.

R (9) Examine the Stage 1 vane platform featherseal. See
R Table 809 and Figure 809.

ENGINE GENERAL - TURBINE NOZZLE - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Figure 801 (Sheet 1) and Figure 801 (Sheet 2)			
Stage 1 vane coat, all surfaces:	All quantities of coat can be missing if burning, erosion and cracks are in the applicable limits of this table and table 802.	See the repair Note: Operation for a long time with dangerous coat loss will sometime cause base material burning, erosion or material degradation because of which the vane becomes not repairable.	Refer to Section 72-51-02, Repair-08 and Repair-14 in the PW4000 Series CIR, PN 51A357
All surfaces material break through/burn through	Not permitted	Not repairable	Remove from service
All surfaces for burning with no measurable depth in the base material	Permitted		

Stage 1 Vane Coat And Surface Damage Inspection
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Concave airfoil surface, convex airfoil surface and platform surfaces, for burning and erosion with measurable depth in the base material	0.010 inch (0.254 mm) maximum depth for 0.010 sq−in (6. sq−mm) maximum total area for each surface		Remove from service
Trailing edge burning and erosion (Burnback)	0.150 inch (3.810 mm) maximum radial length and 0.100 inch (2.540 mm) maximum axial width		Remove from service
Leading edge burning and erosion with measurable depth in the base material	0.010 inch (0.254 mm) maximum depth and 0.300 inch (7.620 mm) maximum diameter		Remove from service
Leading Edge, concave and convex surfaces, trailing edge and platform surfaces for round bottom nicks and dents (other than the fillet radius)	All quantities to a maximum of 0.125 inch (3.175 mm) length or width and 0.0312 inch (0.792 mm) maximum depth	See the repair	Refer to Section 72−51−02, Repair−11 in the PW4000 Series CIR, PN 51A357
		Damage in the airfoil to the platform fillet radius is not repairable	

Stage 1 Vane Coat And Surface Damage Inspection
Table 801 (Continued)

(CONTINUED)			
	convex airfoil cooling hole		
3	One radial crack for each vane starts from the inner diameter or outer diameter platform to a distance of 0.250 inch (6.350 mm) maximum from the platform		
Concave airfoil surface for: See Figure 802 (Sheet 2)			
Cracks that form the closed loop	Not permitted	Not repairable	Remove from service
Cracks (Other than cooling hole)	All quantities of axial or radial cracks 0.120 inch (3.048 mm) maximum length, 0.020 inch (0.508 mm) maximum width. No surface mismatch across a crack in more than 0.020 inch (0.508 mm).	See the repairs	Refer to Section 72-51-02, Repair-12 and Repair-13 in the PW4000 Series CIR, PN 51A357
	Two radial cracks 0.500 inch (12.700 mm) maximum length and		

Stage 1 Vane Crack Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	0.020 inch (0.508 mm) maximum width not extend to the platform. No surface mismatch across a crack in more than 0.020 inch (0.508 mm). Cracks can intersect.		
Cracks (Cooling holes)	One axial crack from one cooling hole group to the next or from the trailing edge to the rear cooling hole group	See the repairs	Refer to Section 72-51-02, Repair-12 and Repair-13 in the PW4000 Series CIR, PN 51A357
	Two axial cracks extend from one cooling hole group half the distance to next cooling hole group or the trailing edge half the distance to the rear cooling hole group		
4 Radial cracks that start on the outer diameter or inner diameter platform	All quantities that extend 0.250 inch (6.350 mm) maximum from platform surface can	See the repairs	Refer to Section 72-51-02, Repair-12 and Repair-13 in the PW4000 Series CIR, PN

Stage 1 Vane Crack Inspection
Table 802 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 vane outer diameter platform non-gaspath side for: See Figure 803			
Impingement cover weld cracks	All quantities of cracks of 0.015 inch (0.381 mm) length	See the repair	Refer to Section 72-51-02, Repair-01 in the PW4000 Series CIR, PN 51A357
Vane cluster weld joint crack	All length of crack(s) is permitted, if 1.000 inch (25.400 mm) of weld joint forward of the inner diameter support flange is not cracked at the inner diameter platform.	See the repair	Refer to Section 72-51-02, Repair-09 and Repair-10 in the PW4000 Series CIR, PN 51A357
Missing impingement cover material	Not permitted	See the repair	Refer to Section 72-51-02, Repair-01 in the PW4000 Series CIR, PN 51A357
Cooling air hole cracks	Not permitted		
Impingement tube cracks	Not permitted		

Stage 1 Vane Outer Diameter Platform (Non-Gaspath Side) Crack Inspection
Table 803

R	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Impingement tube tack weld cracks	A maximum of two cracked welds are permitted		
R	Support flange anti-rotation pin	0.025 inch (0.635 mm) maximum wear for each pin. One missing anti-rotation pin is permitted for each module.	Pin can be replaced	Refer to Section 72-51-02, Repair-05 in the PW4000 Series CIR, PN 51A357

R Stage 1 Vane Outer Diameter Platform
R (Non-Gaspath Side) Crack Inspection
R Table 803 (Continued)

R ENGINE GENERAL - TURBINE NOZZLE - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Inner combustion chamber louvers for: See Figure 804			
Burn through (Open holes)	Not Permitted	More than 0.030 inch (0.762 mm) width patch repair	Refer to Section 72-51-05, Repair-08 in the PW4000 Series CIR, PN 51A357
Bent, buckled or distorted louvers	Permitted if no other limits are exceeded		
Thermal barrier ceramic coat loss	All quantities to a maximum of 20 percent of the total coated area	Local chipping	Refer to Section 72-51-05, Repair-05 in the PW4000 Series CIR, PN 51A357
Axial cracks in a louver	All quantities of 0.020 inch (0.508 mm) maximum width and 0.300 inch (7.620 mm) maximum length	See the repair	Refer to Section 72-51-05, Repair-17 in the PW4000 Series CIR, PN 51A357
	Cracks cannot intersect. Cracks cannot extend into the knuckle area or adjacent louver.		Refer to Section 72-51-05, Repair-06 and Repair-07 in the PW4000 Series CIR, PN 51A357

R Inner Combustion Chamber Non-Talon Burners Inspection
R Table 804

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Continuous axial cracks that extend through the knuckle area and/or into an adjacent louver	Not permitted	Five cracks to a maximum of 0.030 inch (0.762 mm) width can be weld repaired. Cracks in more than 0.030 inch (0.762 mm) Width can be patch repaired.	Refer to Section 72−51−05, Repair−06 and Repair−07 in the PW4000 Series CIR, PN 51A357
Circumferential cracks in the lip region only	2.000 inch (50.800 mm) maximum circumferential length	No limit	Replace the liner segment. Refer to Section 72−51−05, Repair−12, Repair−13, Repair−14, and Repair−15 in the PW4000 Series CIR, PN 51A357.
Circumferential cracks all other locations	Not permitted	A maximum of 7 cracks 1.000 inch (25.400 mm) in length. 6.000 inch (152.400 mm) minimum separation.	Refer to Section 72−51−05, Repair−06, Repair−07 and Repair−08 in the PW4000 Series CIR, PN 51A357
Intersection of cracks (axial and/or circumferential)	Not permitted	No limit	Replace the liner segment. Refer to Section 72−51−05, Repair−12, Repair−13, Repair−14, and Repair−15 in the PW4000 Series CIR, PN

Inner Combustion Chamber Non−Talon Burners Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			51A357.
1 Hardface coat	Wear or chipping that does not bare the base material		Refer to Section 72−51−05, Repair−04 in the PW4000 Series CIR, PN 51A357

Inner Combustion Chamber Non−Talon Burners Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Inner combustion chamber liner segments for: See Figure 805			
Cracks	All quantities of trailing edge cracks 0.200 inch (5.080 mm) maximum length. Cracks must not intersect.	No limit	Replace the liner. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357.
	One crack for each hole starts in a combustion or ignitor hole to a maximum of 0.250 inch (6.350 mm) length and must not intersect. (Other than PN 5lK000)	No limit	Replace the liner. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357.
Burn through (Open holes)	Not permitted	No limit	Replace the liner. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357.
Trailing edge burning or erosion (Missing material)	Can extend axially forward until forward edge of next rearward panel is bare. On last segment row, (Row 6)	No limit	Replace the liner. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357.

Inner Combustion Chamber With Talon (Floatwall) Low Emission Burners Inspection
Table 805

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	burning to a maximum of 0.200 inch (5.080 mm) length is permitted.		
Burn back at corners (Missing material)	0.100 inch (2.540 mm) circumferentially and axially forward until the leading edge of the next rearward panel is bare. 0.100 inch (2.540 mm) axially forward on last (Row 6) segment.	No limit	Replace the liner. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357.
Missing thermal barrier coat	All quantities of spalled and chipped PWA 265 coat, if PWA 265 metallic bond coat is present.	PWA 265 restoration	Refer to Section 72−51−05, Repair−34 in the PW4000 Series CIR, PN 51A357
Liner segment attach nuts and washers	Must not be loose, worn, missing or damaged	No limit	Replace the hardware. Refer to Section 72−51−05, Repair−25 in the PW4000 Series CIR, PN 51A357

Inner Combustion Chamber With Talon (Floatwall) Low Emission Burners Inspection

Cooling duct assembly (TOBI)			
1			
Cracks in all cast surfaces that includes the weld repaired bolt holes	No cracks are permitted	See the repair	Refer to Section 72−51−03, Repair−11 in the PW4000 Series CIR, PN 51A357
Cracks in all the machined surfaces. See Figure 806	All linear indications to a maximum of 0.032 inch (0.813 mm) in length and a minimum separation of 0.135 inch (3.429 mm) are permitted		
2			
Airflow adjustment plug welds	Cracks to a maximum of 0.100 inch (2.540 mm) length separated by at least 0.125 inch (3.175 mm) in all directions are permitted, if they do not extend into the parent material by more than 0.015 inch (0.381 mm).		Remove from service

Cooling Duct Assembly (TOBI) Surface Damage Inspection
Table 806

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
All surfaces for: (other than honeycomb seal area)			
Nicks	0.006 inch (0.152 mm) maximum depth	0.020 inch (0.508 mm) maximum depth	Refer to Section 72-51-03, Repair-25 in the PW4000 Series CIR, PN 51A357
Burning and/or corrosion	Not permitted	Not repairable	Remove from service
Round bottom dents	0.010 inch (0.254 mm) maximum depth	0.020 inch (0.508 mm) maximum depth	Refer to Section 72-51-03, Repair-25 in the PW4000 Series CIR, PN 51A357
Honeycomb Seal area for:			
3 Damaged or bent cells (In knife-edge seal wear areas)	0.025 inch (0.635 mm) maximum depth	Honeycomb can be replaced	Refer to Section 72-51-03, Repair-02 and Repair-16 in the PW4000 Series CIR, PN 51A357

Cooling Duct Assembly (TOBI) Surface Damage Inspection
Table 806 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Damaged or bent cells (Other than knife−edge seal wear areas)	Three rows of cells maximum can be damaged to a maximum of 0.800 inch (20.320 mm) circumferential length on each strip (land)	Honeycomb can be replaced	Refer to Section 72−51−03, Repair−02 and Repair−16 in the PW4000 Series CIR, PN 51A357

Cooling Duct Assembly (TOBI) Surface Damage Inspection
Table 806 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 HPT duct Segment (See Figure 807)			
1 All surfaces for:			
Cracks	Not permitted	Not permitted	Remove from service
Round bottom dents and gouges	0.005 inch (0.127 mm) maximum depth	See the repair	Refer to Section 72-51-06, Repair-02 in the PW4000 Series CIR, PN 51A357
Corrosion and pits	A maximum of 0.005 inch (0.127 mm) depth of pits. Clean to remove all the indications of corrosion.	See the repair	Refer to Section 72-51-06, Repair-02 in the PW4000 Series CIR, PN 51A357

Duct Segment Inspection
Table 807

R ENGINE GENERAL - TURBINE NOZZLE - INSPECTION/CHECK-10

	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	Stage 1 HPT vane support for: See Figure 808			
R	All surfaces unless given differently: Cracks	Not permitted	Cracks in the anti-rotation lugs to a maximum of 0.125 inch (3.175 mm) can be repaired	Refer to Section 72-51-01, Repair-08 in the PW4000 Series CIR, PN 51A357
R	Round bottom nicks, dents and gouges	All quantities of 0.015 inch (0.381 mm) maximum depth	0.015 - 0.040 inch (0.38 - 1.02 mm) depth	Refer to Section 72-51-01, Repair-08 in the PW4000 Series CIR, PN 51A357
R	1 Anti-rotation lug Wear or crack	0.030 inch (0.762 mm) maximum wear depth on the contact face with Stage 1 vane anti-rotation pins. Cracks are not permitted.	See the repair	Refer to Section 72-51-01, Repair-01 and Repair-12 in the PW4000 Series CIR, PN 51A357
R	2 Coated surface worn, chipped or missing coat	A maximum of 15 percent of the top layer of coat can be chipped or missing. No bare material (missing	See the repair	Refer to Section 72-51-01, Repair-02 and Repair-20 in the PW4000 Series CIR, PN 51A357

R Stage 1 Vane Support Inspection
R Table 808

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	bond coat) is permitted.		
Stage 1 vane support for:			
3 Inner diameter surface cracks	All quantities of cooling hole cracks to a maximum of 0.050 inch (1.270 mm) in axial length are permitted	Cracks to a maximum of 0.060 inch (1.524 mm) in the axial length and less than 0.150 inch (3.810 mm) radial depth with no crack indications at the outer diameter end of the cooling holes. All quantities of adjacent cooling holes can be weld repaired.	Refer to Section 72-51-01, Repair-21 in the PW4000 Series CIR, PN 51A357
		Cracks more than 0.060 inch (1.524 mm) in axial length across the inner diameter surface and less than 0.150 inch (3.810 mm) in radial depth with no crack indications at the outer diameter end of the cooling holes. 10 percent of	Refer to Section 72-51-01, Repair-21 in the PW4000 Series CIR, PN 51A357

Stage 1 Vane Support Inspection
Table 808 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		the cooling holes can be weld repaired. Repairs can be completed to a maximum of ten adjacent cooling holes.	
		Cracks more than 0.060 inch (1.524 mm) in axial length across the inner diameter surface and less than 0.350 inch (8.890 mm) in radial depth. Crack indications can be at the outer diameter end of the cooling holes. Repairs can be completed to a maximum of two adjacent cooling holes and no more than 20 cooling holes can be repaired.	Refer to Section 72−51−01, Repair−21 in the PW4000 Series CIR, PN 51A357
4 Anti−rotation lug wear and crack	Not Permitted	Crack to a maximum of 0.125 inch (3.175 mm) length	Refer to Section 72−51−01, Repair−08 and Repair−15 in the PW4000 Series CIR, PN 51A357

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-01

Task 72-00-52-020-001:

1. Remove The High Pressure Turbine - Horizontal

NOTE: See Figure 301 for Part/Assembly Removal Procedure.

A. Prerequisites

(1) Remove The Low Pressure Turbine. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(2) Remove The External Plumbing Prior To High Pressure Turbine Removal. Refer to 72-00-52, Removal-03 (Task 72-00-52-020-003).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25000	Wrench, Hydraulic
PWA 28657	Sling, Strongback
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical*
PWA 45419	Air Torque Multiplier* (Use With Mechanical Wrench)
PWA 76156	Adapter (2 Required)
PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
PWA 85107	Fixture, Handling
PWA 85110	Puller, Knocker
PWA 85112	Fixture, Retaining (Optional)
PWA 85114	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85115	Adapter, Wrench (Use With Hydraulic Wrench)
PWA 85116	Wrench, Torque* (Use With Mechanical Wrench)
PWA 85117	Adapter, Wrench* (Use With Mechanical Wrench)
PWA 85984	Adapter, Stabilizing (Optional for operators that hang the engine from an overhead rail support. See the NOTE).
PWA 86058	Retainer, Storage (Optional)
PWA 86537	Cover, Protective (Optional)
PWA 87022	Stand, Storage
PWA 102746	Puller (If Necessary)

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−01

Special Tools:

(CONTINUED)

*See Table 301 for the mechanical wrench tool options as applicable. The table shows the correct combinations of tools to remove the No. 3 bearing retaining nut.

NOTE: For operators that use an overhead rail support to hang the engine, use PWA 85107 Fixture that incorporates Change F, PWA 85984 Adapters and two stabilizing cables. (Reference Tool Bulletin 89−303). Adjust the turnbuckle cables as required to stabilize the turbine.

C. Procedure

CAUTION: FOR ENGINES THAT HAVE SIGNS OF HPT BLADE DAMAGE AND/OR FRACTURE, IT IS NECESSARY THAT YOU DO THE FOLLOWING INSPECTIONS WHEN YOU DO THE DETAIL PART INSPECTIONS:

CAUTION: YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR OR WEAR STEP ON THE HOUSING JOURNAL OR SHOULDER. NO WEAR OR WEAR STEP IS PERMITTED. SEE PW4000 SERIES CIR, PN 51A357, 72−41−10, INSPECTION/CHECK−03 AND −04 FOR THE SPECIFIC INSPECTION LIMITS.

CAUTION: YOU MUST EXAMINE THE NO. 3 BEARING REAR CARBON SEAL RING HOLDER FOR WEAR OR DAMAGE TO THE CARBON SEAL RING PINS. SEE PW4000 SERIES CIR, PN 51A357, 72−41−86, INSPECTION/CHECK−03 FOR THE SPECIFIC INSPECTION LIMITS.

CAUTION: YOU MUST EXAMINE THE NO. 1.5 AND 2 BEARING SEAL SUPPORT ASSEMBLY FOR BRAZE CRACKS AND/OR PIN FRACTURE. NO CRACK INDICATIONS OF ANY LENGTH OR DEPTH ARE PERMITTED. SEE PW4000 SERIES CIR, PN 51A357, 72−34−36, INSPECTION/CHECK−02 FOR THE SPECIFIC INSPECTION LIMITS.

(1) Remove retaining ring lock (302/3) securing No. 3 bearing nut lock (302/2) to (No.3) bearing retaining nut. See Figure 302.

(2) Remove No. 3 bearing nut lock (302/2) using PWA 85110 Knocker Puller.

(a) Position lugs on plate detail of puller between tabs of nut lock and insert plate into ID of nut lock. Rotate plate clockwise to engage hooked lugs with tabs of nut lock.

(b) Using slide hammer action, remove nut lock from engine.

(3) Remove remaining retaining ring lock (302/3) from No. 3 bearing retaining nut.

(4) For operators that use the mechanical wrench, remove the No. 3 bearing retaining nut as follows:

(a) Install PWA 85116 Wrench into ID of No. 3 bearing retaining nut (303/7) engaging splines of wrench with splines of nut. See Figure 303.

(b) Install PWA 85117 Adapter to turbine intermediate hub (303/6). See Figure 303.

1 Loosen hex nuts (303/5) securing eight clamps (303/4). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with hex nuts.

2 Connect hoist to lifting eye on adapter.

3 Using hoist, position adapter to rear of PWA 85116 Wrench.

4 Insert clamps (303/4) through slots (303/1) between lugs in turbine intermediate hub (303/6).

5 Align teeth of adapter with slots between lugs of hub. Loosen hex nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and insert pins (303/3) into holes in base of adapter. Tighten hex nuts to secure clamps.

NOTE: Plate detail of clamp points in direction that clamp feet are facing.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−01

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85116 Wrench. Align anti−torque pins in wrench with bushings (304/1) in PWA 85117 Adapter and seat wrench on adapter. See Table 301 for mechanical wrench options. See Figure 304.

NOTE: Wrenches may be actuated using air torque multipliers to speed up removal of nut. See Table 301.

PWA Mechanical Wrench	PWA Torque Multiplier
PWA 29614	PWA 45419 or PWA 80651

Mechanical Wrench Options
Table 301

(d) Actuate wrench to loosen nut.

(e) Remove wrenches and adapter. Remove nut from HPC (rear hub).

NOTE: No. 3 bearing retaining nut silver plating shall have been replaced prior to each installation. Nut may be removed and retorqued for each installation maximum of three times prior to engine run before requiring silver plating replacement.

(5) For operators that use the a hydraulic wrench, remove the No. 3 bearing retaining nut as follows: See Figure 305.

(a) Install PWA 85114 Wrench into ID of No. 3 bearing retaining nut (305/5) engaging splines of wrench with splines of nut.

(b) Install PWA 85115 Adapter to turbine intermediate hub (305/6).

1 Loosen wing nuts securing eight clamps (305/3). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with wing nuts.

2 Install eyebolt into threaded hole at top of adapter and connect hoist to eyebolt.

3 Using hoist, position adapter over PWA 85114 Wrench and onto rear of HPT.

4 Insert clamp feet through slots (305/1) between lugs of turbine intermediate hub.

5 Align 16 teeth of adapter with slots between lugs of turbine intermediate hub. Loosen wing nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and secure with wing nuts.

NOTE: Dowel pin (305/4) in stud detail of clamp points in direction that clamp feet are facing.

(c) Use a hoist and applicable sling to lift the PWA 25000 Hydraulic Wrench. Find the correct direction to turn the drive spline of the wrench. Refer to the PWA 29178 Instruction Decal on the hydraulic wrench to get the position of the shifting mechanism to cause the drive spline to turn in the loosen direction. See Figure 306.

NOTE: PWA 28669 Cart can be used to store and transport PWA 25000 Wrench.

(d) Connect PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench. Operate the wrench to make sure that the wrench turns in the loosen direction.

(e) Align splines and position PWA 25000 Wrench onto PWA 85114 Wrench. Move wrench forward and engage keys of PWA 85115 Adapter with keyways in PWA 25000 Wrench. See Figure 306.

CAUTION: DO NOT USE A TORQUE OF MORE THAN 1,000,000 LB−IN. (112,985 N.m) OR STRUCTURAL DAMAGE TO THE TURBINE SHAFT CAN OCCUR.

(f) Use the selector to operate the wrench and loosen the nut. Monitor the pressure gages to make sure that the torque does not exceed 1,000,000 lb−in. (112,985 N.m). As the drive spline turns, look at the travel indicator. When the travel indicator reaches its maximum travel, use the selector control valve to let the wrench ratchet return. Repeat this procedure until the nut is loose.

(g) Connect PWA 28668 Pump or PWA 29510 Pump to wrench.

(h) Actuate wrench to loosen nut.

(i) Remove wrenches and adapter. Remove nut from HPC rear hub.

NOTE: No. 3 bearing retaining nut silver plating shall have been replaced prior to each installation. Nut may be removed and retorqued for each installation maximum of three times prior to engine run before requiring silver plating replacement.

CAUTION: ENGINES INCORPORATING NO. 3 BEARING RETAINING NUT PN 50A132 INCORPORATE SHORTER TURBINE SHAFT SPACER WHICH MAY FALL INTO GROOVE IN HPC REAR HUB JUST FORWARD OF THREADS AT REAR OF HUB. INSTALL WORK PACKING INTO GROOVE IN HPC REAR HUB JUST FORWARD OF THREADS OR DAMAGE TO HPC REAR HUB MAY OCCUR.

(6) Determine part number of No. 3 bearing retaining nut. For engines incorporating nut PN 50A132, install work packing PN AS3209−159 into groove in HPC rear hub just forward of threads at rear of hub.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(7) Install PWA 85107 Fixture onto high pressure turbine. See Figure 307.

(a) If installed, remove rod and attached details, guide pilot, clamp and nuts from coupler. Remove nut and hydraulic cylinder. Remove plug.

(b) Remove 12 screws (307/9) securing plate (307/10) to fixture. Remove retainer (307/11) and jaws (307/4).

(c) For engines (Pre SB PW4ENG 72−176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379 ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(d) For engines (Post SB PW4ENG 72-176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72-176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(e) Loosen eight hand knobs (307/14) at center hub (307/2) of fixture and move piloting ring (307/3) rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(f) Attach suitable sling to two hoist rings and position fixture onto rear of high pressure turbine.

(g) Secure outer flanges of fixture to high pressure turbine case (307/1) using 26 detail screws (307/12) and spacers (307/13). Remove hoist and sling.

(h) Loosen eight hand knobs (307/14) at center hub and push pilot ring (307/3) forward until it seats against turbine rear hub. Tighten eight hand knobs.

(i) Position four jaws (307/4) into center of fixture, locating lip of jaws in ID cutout of turbine hub. Lightly tighten screws (307/5) to secure jaws.

(j) Thread extension rod (307/7) into plug (307/6). Insert assembly into center of fixture and seat plug against rear of high pressure compressor shaft.

(k) Install retainer (307/11) into center of fixture to retain four jaws (307/4). Tighten four screws (307/5) to secure jaws.

(l) Install plate (307/10) to pilot ring (307/3) and secure with 12 screws (307/9).

(m) Thread hydraulic cylinder (307/8) into plate (307/10).

(8) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Take up slack on sling cables.

(9) Remove Flange M lockwire, bolts, nuts and brackets securing turbine case front flange to diffuser case. Refer to 72−00−52, Removal−20 (Task 72−00−52−020−020).

(10) Attach PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to ram and apply hydraulic pressure to separate turbine front hub from HPC (rear hub) (approximately 0.750 inch (19.050 mm), while separating turbine case flange from diffuser case.

(a) If necessary, use PWA 102746 Puller to help when you remove the HPT from the HPC.

(11) Remove pump and hydraulic cylinder.

(12) Move turbine rearward and separate it from engine.

(13) Remove turbine shaft spacer from HPC rear hub. If installed, remove work packing from groove in HPC rear hub just forward of threads at rear of hub.

(14) Optional, insert PWA 85112 Retaining Fixture into ID of turbine hubs and align outer surfaces of fixture with turbine hub lock. Rotate knurled knob to secure fixture against lock.

(15) Remove gasket (308/1) from front outer flange of turbine case. See Figure 308.

(16) Place the turbine front end down into the PWA 87022 Storage Stand. See Figure 309.

(17) Optional, position the PWA 86537 Cover between the HPT blades and the PWA 85107 Fixture so that each of the four detail pieces overlaps the adjacent piece.

(18) Adjust the center plug of the storage stand to maintain the running clearance of the turbine rotors. Secure the assembly in the stand.

(19) Remove the fixture from the turbine case.

- (a) Remove 12 screws (309/1) securing plate (309/2) to piloting ring (309/10). Remove plate. Store screw details in plate.
- (b) Remove retainer (309/3), extension rod (309/4) and plug (309/5).
- (c) Loosen screws (309/7) securing jaws (309/6) to hub. Remove jaws.
- (d) Remove screws (309/9) and spacers (309/8) securing fixture to case.
- (e) Using hoist and PWA 28657 Sling, remove fixture from case.

(20) If the turbine assembly will be moved while in PWA 87022 Stand, install PWA 86058 Retainer to prevent damage to the knife−edge seals. See Figure 310.

- (a) Put the retainer onto the rear flange of the turbine intermediate hub.
- (b) Align the boltholes and secure the outer flange of the retainer with 14 detail screws and nuts.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-02

Task 72-00-52-020-001-002:

1. Remove The High Pressure Turbine - Horizontal (Hydraulic Wrench) - Deleted

    A. Procedure

        (1) This procedure is relocated to 72-00-52, Removal-01 (Task 72-00-52-020-001).

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-03

Task 72-00-52-020-003:

1. Remove The External Plumbing Prior To The High Pressure Turbine Removal
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 301.
      (1) Remove the EEC PT4.95 tube assembly (AS27) as follows.
         (a) Remove the lockwire. Disconnect the tube nut from tube coupling forward of Flange M at approximately 9 o'clock position.
         (b) Remove the bolt, nut and clamp that attach the tube to the diffuser case bracket at approximately 9 o'clock position.
         (c) Remove the bolt, nut and clamp that attach the tube to the adjacent tube forward of Flange M at approximately 8 o'clock position. Remove the tube from the engine. Install covers.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-04

Task 72-00-52-050-001:

1. Remove Turbine Case Cooling (TCC) Air Valve (HPT)

   A. Prerequisites

      (1) Remove LPT turbine case cooling (TCC) air valve per 72-00-53, Removal-07, Task 72-00-53-050-001.

   B. Equipment And Materials Required - None

   C. Procedure
   See Figure 301 and Figure 302.

      (1) Disconnect the control cable from the HPT valve idler arm interface point.

      (2) Remove bolts securing upper flange of valve and support link to upper support bracket.

      (3) Position upper support link inward toward case.

      (4) Remove bolts and nuts securing lower flange of valve to lower support bracket.

      (5) Slide valve rearward and outward from between upper and lower support brackets.

      (6) Remove the bolt and nut that attaches the turnbuckle rod end to the idler arm on the valve and remove the rod from the valve.

      (7) FOR THESE MODELS: 4152, 4156A, 4158
      (Pre SB PW4ENG 75-74) If the valve must be replaced, remove the nut that attaches the idler arm to the valve lever and remove the arm and spacer from the valve lever.

      (8) (Pre SB PW4ENG 75-136) If the valve must be replaced, remove the nut that attaches the idler arm to the valve lever and remove the arm from the valve lever.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−04

(9) (Post SB PW4ENG 75−136) If the valve must be replaced, remove the bearing sleeve assembly that attaches the idler arm to the valve lever and remove the arm from the valve lever.

NOTE: For additional information concerning detailed maintenance of this component see Turbine Case Cooling Air Valve (HPT) Component Maintenance Manual, 75−24−09, (Parker Hannifin).

(10) Examine the bushing and bearing in the idler arm for wear and damage. If necessary, remove the bushing (as applicable) and bearing as follows:

(a) Remove the bearing retaining ring from the idler arm.

(b) Put the idler arm on a work bench with the bearing retaining ring groove side down.

(c) Put a support around the OD of the bearing on the idler arm.

(d) Put a drift on the bearing and carefully hit the drift with a hammer to remove the bearing.

(e) To remove the bushing, put the idler arm on a work bench with the bushing flange side down.

(f) Put a support around the OD of the bushing on the idler arm.

(g) Put a drift on the bushing and carefully hit the drift with a hammer to remove the bushing.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-05

Task 72-00-52-050-002:

1. Remove (HPT) Turbine Case Cooling Manifold (Collector)
    A. Prerequisites
        (1) Remove EEC thermocouple and airframe cable (W6) as required per 72-00-54, Removal-09 (Task 72-00-54-050-006).
        (2) Remove only the lower right turbine cooling tube per Removal-07 (Task 72-00-52-050-004).
    B. Equipment And Materials Required - None
    C. Procedure
        See Figures 301 through 303.

        (1) Remove eight bolts (301/2) securing turbine case cooling manifolds to turbine case cooling manifold (collector) (301/1). See Figure 301.
        (2) Loosen bolts (302/1) and clamps (302/2) securing cooling manifolds to support brackets at six locations. See Figure 302.
        (3) Slide upper and lower cooling manifolds around case as required to clear turbine case cooling manifold (collector) (303/2). See Figure 303.
        (4) Remove bolt (303/8) spacer (303/7) and nut (303/4) securing clamp (303/5) to bracket on Flange M. Remove screw (303/3) and nut (303/6) securing clamp (303/5) to turbine case cooling manifold (collector) (303/2).
        (5) Remove bolts and nuts (303/11) and (303/13) securing bracket (303/12) to engine.
        (6) Remove bolts and nuts (303/10) securing manifold (collector) (303/2) to TCC valve support (303/9) and turbine case cooling air shutoff valve (HPC) (303/1). Remove manifold (collector) (303/2).

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-06

Task 72-00-52-050-003:

1. Remove Turbine Case Cooling Manifolds (HPT)

A. Prerequisites

(1) Remove EEC thermocouple and airframe cable (W6) as necessary by 72-00-54, Removal-09 Task 72-00-54-050-006-A00.

B. Equipment And Materials Necessary - None

C. Procedure
See Figures 301, 302 and 303.

(1) Remove (rear) No. 4 bearing oil pressure tube assembly (LP16) as follows.

(a) Remove two clamps securing spray shield, to the tube connection and if equipped a bracket, forward of Flange M at approximately 10 o'clock position. Remove the spray shield from the engine. Remove lockwire and disconnect tube nut from tube adapter.

(b) Remove clamp securing spray shield to rear tube connection on exhaust case and remove spray shield. Remove lockwire and disconnect tube nut.

(c) Remove bolts, nuts, and clamps securing tube to brackets attached to Flanges M, N, and P.

(d) Remove bolt, spacer, nut, and clamps securing tube to adjacent scavenge tube rearward of Flange N. Remove tube from engine.

(2) (Pre SB PW4ENG 79-75) Remove (rear) No. 4 bearing oil scavenge tube assembly as (LR06) as follows.

(a) Remove lockwire and disconnect rear scavenge tube elbow from exhaust case internal tube at approximately 10 o'clock position.

(b) Remove bolt, nut, and clamp securing spray shield to bracket on Flange M. Remove clamp securing forward end of spray shield to tube and remove spray shield.

(c) Remove lockwire and disconnect tube nut at Flange M from tube adapter.

(d) Remove bolts, nuts, and clamps securing tube to brackets on Flanges N and P. Remove rear scavenge tube from engine.

(3) (Post SB PW4ENG 79−75) Remove (rear) No. 4 bearing scavenge tube assembly (LR06) as follows.

(a) Remove hose clamp securing the tube shield to the bracket inboard side of Flange M at approximately 7 o'clock position. Remove the lockwire and disconnect the (LR05) hose and tube assembly nut from the (LR06) tube coupling.

(b) Remove lockwire and disconnect tube elbow from exhaust case internal tube nut at approximately 10 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flanges N and P brackets. Remove tube from engine and install protective closures.

(d) Remove bolts, nuts and clamp bracket attached to Flanges M and N brackets at approximately 7 o'clock position.

(4) Remove (rear) No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Remove lockwire and disconnect oil vent tube from adapter on turbine exhaust case at approximately 7 o'clock position.

(b) Remove lockwire and disconnect tube nut at tube connection just rearward of Flange M.

(c) Remove bolt, nut, and clamp securing tube to bracket on Flange N.

(d) Remove bolts, nuts, and clamps securing tube to Flange P brackets.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that secures the tube to the adjacent PT4.95 tube assembly (Post SB PW4ENG 72−134).

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that attaches the tube to the adjacent PT4.95 tube assembly.

(g) Remove bolt, nut, and clamp securing tube to adjacent tube between Flanges N and P. Remove tube from engine and install protective closures.

(5) Remove (rear) EEC PT4.95 tube assembly (AS02) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove lockwire from tube nut securing tube to the tee at the 6 o'clock position (water drain) on PT4.95 manifold, rearward of Flange P and disconnect tube nut (Pre SB PW4ENG 72−134).

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position (Post SB PW4ENG 72−134).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolt, nut, and clamp that secures the tube to the Flange P bracket at approximately the 7 o'clock position (Pre SB PW4ENG 72−134).

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position.

(e) Remove lockwire from tube connection rearward of Flange N at approximately the 8 o'clock position and disconnect tube nut from tube adapter.

(f) Remove the tube from the engine and install protective closures.

(6) Remove all bolts at cooling manifold ends which secure manifolds (AC21) through (AC28) (upper and lower) to cooling manifold (collector) detail tubes.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−06

(7) Remove bolts and nuts securing front lower cooling manifold clamps to brackets and remove clamps. Disengage manifold from (collector) and remove manifold from engine.

(8) Remove bolts and nuts securing front upper cooling manifold clamps to brackets and remove clamps. Disengage manifold from (collector) and remove manifold from engine.

(9) Remove the center two bolts and nuts on the bridge brackets (6 places), to disengage the center TCC tubes (upper and lower) from the bridge brackets.

(10) Remove two end bolts and nuts securing lower bridge brackets (3 places) to Flanges M and N brackets. Disengage lower, center two, cooling manifolds from manifold (collector) and remove manifolds from engine.

(11) Remove the two end bolts and nuts securing upper bridge brackets (3 places) to Flanges M and N brackets. Disengage upper, center two, cooling manifolds from manifold (collector) and remove manifolds from engine.

(12) Remove bolts, nuts and clamps securing upper and lower rear cooling manifolds to brackets. Disengage manifolds from collector and move rearward for access to brackets.

(13) Remove bolts and nuts securing rear upper and lower cooling manifold brackets to support brackets on Flange N.

(14) Remove bolts and nuts securing LPT bridge brackets to Flange N brackets, as required and remove Flange N brackets for clearance to remove HPT rear cooling manifolds.

(15) Remove rear upper and lower cooling manifolds.

(16) Install protective closures.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-07

Task 72-00-52-050-004:

1. Remove Turbine Cooling Tubes

   A. Equipment And Materials Required - None

   B. Procedure

      (1) Remove the turbine vane cooling air duct (upper right) (AP01) as follows. See Figure 301.

         (a) Remove lockwire and bolts securing rear flange of cooling air duct to boss on HPT case at approximately the 1 o'clock position.

         (b) Remove lockwire and bolts securing front flange of cooling air duct and bracket to boss on HPC case.

         (c) Remove lockwire and bolts securing clamp to support on diffuser case and remove clamp.

         (d) Remove cooling air duct from engine.

         (e) Remove and discard the gasket from the boss on the HPC case.

         (f) (Pre SB PW4ENG 72-315) Remove and discard the gasket (post SB PW4ENG 75-57) from the boss on the HPT case.

         (g) (Post SB PW4ENG 72-315) Remove and discard the metering orifice seal plate from the boss on the HPT case.

         (h) Install protective closures.

      (2) Remove turbine vane cooling air duct (lower right) (AP02) as follows. See Figure 301.

         (a) Remove lockwire, bolts, and bracket securing rear flange of cooling air duct to boss on HPT case at approximately 4 o'clock position.

         (b) Remove bolts securing front flange of cooling air duct to flange of turbine vane and blade cooling air valve on the HPC case.

(c) Remove bolts, nuts and clamp that attach the cooling air duct to the bracket on Flange M and remove the duct from the engine. Discard the gasket from the front of the duct and the metering orifice seal plate (Engines without SB PW4ENG 75−57 or SB PW4ENG 72−315) or the gasket (Engines with SB PW4ENG 75−57 or SB PW4ENG 72−315) from the rear of the duct.

(d) Install protective closures.

(3) Remove turbine vane cooling air duct (upper Left) (AP04) as follows. See Figure 302.

(a) Remove the bolts that attach the front flange of the cooling air duct to the flange of the turbine vane cooling air valve on the HPC case. Remove and discard the gasket.

(b) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 9 o'clock position.

(c) Remove bolts, nuts, and clamp securing cooling air duct to bracket on diffuser case pad and remove duct from engine. Discard the gasket (Engines with SB PW4ENG 72−315 or SB PW4ENG 75−57) or metering orifice seal plate (Engines without SB PW4ENG 72−315 or SB PW4ENG 75−57).

(d) Install protective closures.

CAUTION: REMOVE BORESCOPE PLUG (IF EQUIPPED) FROM LOWER LEFT TURBINE VANE COOLING AIR DUCT ELBOW PRIOR TO REMOVAL OF DUCT. FAILURE TO DO SO COULD RESULT IN DAMAGE TO PLUG.

(4) Remove turbine vane cooling air duct (lower left) (AP03) as follows. See Figure 302.

(a) For engines equipped, remove lockwire and three bolts securing borescope plug to rear elbow. If necessary use two jackscrews (.190−32 thread) and remove borescope plug evenly.

(b) Remove the lockwire and bolts that attach the front flange of the cooling air duct and tube bracket to the boss on the HPC case.

(c) Remove the bolt and nut that attach the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air tube (AP03).

NOTE: The spray shield for the manifold can stay with the clamp.

(d) Loosen clamp bolt securing No. 4 bearing oil pressure tube (front) (LP15) to bracket at front flange of duct. Move the bracket to permit removal of the duct.

(e) Remove lockwire and bolts securing rear flange of cooling air duct to boss on HPT case at approximately the 7 o'clock position.

(f) Remove bolts, nuts, and clamp securing cooling air duct to bracket on diffuser case pad and remove cooling air duct from engine.

(g) Remove and discard the gasket from the boss on the HPC case.

(h) Remove and discard the metering orifice seal plate from the boss on the HPT case (Engines with SB PW4ENG 72-315 and without SB PW4ENG 75-57).

(i) Remove and discard the gasket from the boss on the HPT case (Engines without SB PW4ENG 72-315 and with SB PW4ENG 75-57).

(j) Install protective closures.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−07

Task 72−00−52−050−005:

1. Remove Turbine Cooling Tubes

    A. Equipment And Materials Required − None

    B. Procedure

        (1) Remove the (upper right) turbine vane cooling air duct (AP01) as follows. See Figure 301.

            (a) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 1 o'clock position.

            (b) Remove the lockwire and bolts that attach the front flange of the cooling air duct to the flange of the turbine vane cooling air valve on the HPC case.

            (c) Remove the lockwire and bolts that attach a clamp to the support on the diffuser case. Remove the clamp.

            (d) Remove the cooling air duct from the engine.

            (e) Remove and discard the gasket from the front flange of the duct.

            (f) Remove the metering orifice seal plate from the boss on the HPT case and discard the plate.

            (g) Install protection covers.

        (2) Remove the (lower right) turbine vane cooling air duct (AP02) as follows. See Figure 301.

            (a) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 4 o'clock position.

            (b) Remove the bolts which attach the front flange of the cooling air duct to the flange of the turbine vane and blade cooling air valve on the HPC case.

            (c) Remove the bolts, nuts and clamp that holds the cooling air duct to the bracket on Flange M. Remove the duct from the engine and discard the gaskets.

(d) Install protection covers.

(3) Remove turbine vane cooling air duct (upper Left) (AP04) as follows. See Figure 302.

(a) Remove the bolts that attach the front flange of the cooling air duct to the flange of the turbine vane cooling air valve on the HPC case. Remove and discard the gasket.

(b) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 9 o'clock position.

(c) Remove the bolts, nuts and clamp that attaches the cooling air duct to the bracket on the diffuser case pad and remove the duct from the engine. Discard the gaskets.

(d) Install protective closures.

CAUTION: REMOVE BORESCOPE PLUG (IF EQUIPPED) FROM LOWER LEFT TURBINE VANE COOLING AIR DUCT ELBOW PRIOR TO REMOVAL OF DUCT. FAILURE TO DO SO COULD RESULT IN DAMAGE TO PLUG.

(4) Remove turbine vane cooling air duct (lower left) (AP03) as follows. See Figure 302.

(a) For engines equipped, remove lockwire and three bolts securing borescope plug to rear elbow. If necessary use two jackscrews (.190−32 thread) and remove borescope plug evenly.

(b) Remove the lockwire and bolts that attach the front flange of the cooling air duct and tube bracket to the boss on the HPC case.

(c) Remove the bolt and nut that attach the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air tube (AP03).

NOTE: The spray shield for the manifold can stay with the clamp.

(d) Loosen clamp bolt securing No. 4 bearing oil pressure tube (front) (LP15) to bracket at front flange of duct. Move the bracket to permit removal of the duct.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−07

(e) Remove lockwire and bolts securing rear flange of cooling air duct to boss on HPT case at approximately the 7 o'clock position.

(f) Remove bolts, nuts, and clamp securing cooling air duct to bracket on diffuser case pad and remove cooling air duct from engine.

(g) Remove and discard the gasket from the boss on the HPC case.

(h) Remove and discard the metering orifice seal plate from the boss on the HPT case.

(i) Install protective closures.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-08

Task 72-00-52-020-002:

1. Remove The High Pressure Turbine - Vertical

NOTE: See Figure 301 for Part/Assembly Removal Procedure.

A. Prerequisites

(1) Remove The Low Pressure Turbine. Refer to 72-00-53, Removal-01 (Task 72-00-53-020-001).

(2) Remove The External Plumbing Prior To High Pressure Turbine Removal. Refer to 72-00-52, Removal-03 (Task 72-00-52-020-003).

B. Equipment And Materials Required

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25000	Wrench, Hydraulic
PWA 28657	Sling, Strongback
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical*
PWA 45419	Air Torque Multiplier* (Use With Mechanical Wrench)
PWA 76154	Adapter (2 Necessary)
PWA 76156	Adapter (2 Necessary)
PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
PWA 85107	Fixture, Handle
PWA 85110	Puller, Knocker
PWA 85112	Fixture, Retaining (Optional)
PWA 85114	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85115	Adapter, Wrench (Use With Hydraulic Wrench)
PWA 85116	Wrench, Torque* (Use With Mechanical Wrench)
PWA 85117	Adapter, Wrench* (Use With Mechanical Wrench)
PWA 86058	Retainer, Storage (Optional)
PWA 86537	Cover, Protective (Optional)
PWA 87022	Stand, Storage
PWA 88643	Sling, Lifting
PWA 88673	Sling, Lifting
PWA 102746	Puller (If Necessary)

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−08

Special Tools:

(CONTINUED)

*See Table 301 for the mechanical wrench tool options. The table shows the correct combinations of tools to remove the No. 3 bearing retaining nut.

C. Procedure

CAUTION: FOR ENGINES THAT HAVE SIGNS OF HPT BLADE DAMAGE AND/OR FRACTURE, IT IS NECESSARY THAT YOU DO THE FOLLOWING INSPECTIONS WHEN YOU DO THE DETAIL PART INSPECTIONS:

CAUTION: YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR OR WEAR STEP ON THE HOUSING JOURNAL OR SHOULDER. NO WEAR OR WEAR STEP IS PERMITTED. SEE PW4000 SERIES CIR, PN 51A357, 72−41−10, INSPECTION/CHECK−03 AND −04 FOR THE SPECIFIC INSPECTION LIMITS.

CAUTION: YOU MUST EXAMINE THE NO. 3 BEARING REAR CARBON SEAL RING HOLDER FOR WEAR OR DAMAGE TO THE CARBON SEAL RING PINS. SEE PW4000 SERIES CIR, PN 51A357, 72−41−86, INSPECTION/CHECK−03 FOR THE SPECIFIC INSPECTION LIMITS.

CAUTION: YOU MUST EXAMINE THE NO. 1.5 AND 2 BEARING SEAL SUPPORT ASSEMBLY FOR BRAZE CRACKS AND/OR PIN FRACTURE. NO CRACK INDICATIONS OF ANY LENGTH OR DEPTH ARE PERMITTED. SEE PW4000 SERIES CIR, PN 51A357, 72−34−36, INSPECTION/CHECK−02 FOR THE SPECIFIC INSPECTION LIMITS.

(1) Optional, position PWA 86537 Cover over the turbine blades so that each of the four detail pieces overlaps the adjacent piece.

(2) Remove retaining ring lock (302/3) securing No. 3 bearing nut lock (302/2) to No. 3 bearing retaining nut. See Figure 302.

(3) Remove No. 3 bearing nut lock (302/2) using PWA 85110 Knocker Puller.

(a) Position lugs on plate detail of puller between tabs of nut lock and insert plate into ID of nut lock. Rotate plate clockwise to engage hooked lugs with tabs of nut lock.

(b) Using slide hammer action, remove nut lock from engine.

(4) Remove remaining retaining ring lock (302/3) from No. 3 bearing retaining nut.

(5) For operators that use the mechanical wrench, remove the No. 3 bearing retaining nut as follows.

(a) Install PWA 85116 Wrench into ID of No. 3 bearing retaining nut (303/3) engaging splines of wrench with splines of nut. See Figure 303.

(b) Install PWA 85117 Adapter to turbine intermediate hub (303/4). See Figure 303.

1 Loosen hex nuts (303/1) securing eight clamps (303/2). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with hex nuts.

2 Use a hoist and two PWA 76154 Adapters and connect PWA 88643 Sling, PWA 88673 Sling or PWA 28657 Sling to the trunnion spools on the adapter.

3 Using hoist, position adapter over rear of PWA 85116 Wrench.

4 Insert clamp feet through slots (303/6) between lugs of hub.

5 Align teeth of adapter with slots between lugs of turbine intermediate hub. Loosen hex nuts and slide clamps in direction of arrows on base of adapter. Rotate clamps (303/2) as required to position feet under lugs on hub and insert pins (303/3) into holes in base of adapter. Tighten hex nuts to secure clamps.

NOTE: Plate of clamp points in direction that clamp feet are facing.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85116 Wrench. Align anti−torque pins in wrench with bushings (304/1) in PWA 85117 Adapter and seat wrench on adapter. See Table 301 for mechanical wrench options. See Figure 304.

NOTE: Wrenches can be actuated using air torque multipliers to speed up removal of nut. See Table 301.

PWA Mechanical Wrench	PWA Torque Multiplier
PWA 29614	PWA 45419 or PWA 80651

Mechanical Wrench Options
Table 301

(d) Actuate wrench to loosen nut.

(e) Remove wrenches and adapter.

(f) Remove nut from HPC (rear hub).

NOTE: No. 3 bearing retaining nut silver plating shall have been replaced prior to each installation. Nut may be removed and retorqued for each installation maximum of three times prior to engine run before requiring silver plating replacement.

(6) For operators that use the hydraulic wrench, remove the No. 3 bearing retaining nut as follows:

(a) Install PWA 85114 Wrench into ID of No. 3 bearing retaining nut (305/3) engaging splines of wrench with splines of nut. See Figure 305.

(b) Install PWA 85115 Adapter to turbine intermediate hub (305/4).

1 Loosen wing nuts securing eight clamps (305/1). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with wing nuts.

2 Install three .500−13 inch eyebolts into three equally spaced holes near center of adapter. Using hoist, connect suitable sling to eyebolts.

3 Using hoist, position adapter over PWA 85114 Wrench and onto rear of HPT with 16 teeth of adapter between lugs of turbine intermediate hub.

4 Insert clamp feet through slots (305/5) between lugs of hub.

5 Loosen wing nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps to position feet under lugs on hub and secure with wing nuts.

NOTE: Dowel pin (305/2) in stud detail of clamp points in direction that clamp feet are facing.

CAUTION: YOU MUST TURN THE PWA 25000 HYDRAULIC WRENCH ONLY IN THE LOOSEN DIRECTION. IF YOU TURN THE DRIVE SPLINE IN THE TIGHTEN DIRECTION, YOU CAN STRUCTURALLY DAMAGE THE TURBINE SHAFT.

(c) Use a hoist and applicable sling to lift the PWA 25000 Hydraulic Wrench. Find the correct direction to turn the drive spline of the wrench. Refer to the PWA 29178 Instruction Decal on the hydraulic wrench to get the position of the shifting mechanism to cause the drive spline to turn in the loosen direction. See Figure 306.

NOTE: PWA 28669 Cart can be used to store and transport PWA 25000 Wrench.

(d) Connect PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench. Operate the wrench to make sure that the wrench turns in the loosen direction.

(e) Align splines and lower PWA 25000 Wrench onto PWA 85114 Wrench. Lower wrench and engage keys of PWA 85115 Adapter with keyways in PWA 25000 Wrench. See Figure 306.

CAUTION: DO NOT USE A TORQUE OF MORE THAN 1,000,000 LB−IN. (112,985 N.m) OR STRUCTURAL DAMAGE TO THE TURBINE SHAFT CAN OCCUR.

(f) Use the selector to operate the wrench and loosen the nut. Monitor the pressure gages to make sure that the torque does not exceed 1,000,000 lb−in. (112,985 N.m). As the drive spline turns, look at the travel indicator. When the travel indicator reaches its maximum travel, use the selector control valve to let the wrench ratchet return. Repeat this procedure until the nut is loose.

(g) Connect PWA 28668 Pump or PWA 29510 Pump to wrench.

(h) Actuate wrench to loosen nut.

(i) Remove wrenches and adapter.

(j) Remove nut from HPC rear hub.

NOTE: No. 3 bearing retaining nut silver plating shall have been replaced prior to each installation. Nut may be removed and retorqued for each installation maximum of three times prior to engine run before requiring silver plating replacement.

CAUTION: ENGINES INCORPORATING NO. 3 BEARING RETAINING NUT PN 50A132 INCORPORATE SHORTER TURBINE SHAFT SPACER WHICH MAY FALL INTO GROOVE IN HPC REAR HUB JUST FORWARD OF THREADS AT REAR OF HUB. INSTALL WORK PACKING INTO GROOVE IN HPC REAR HUB JUST FORWARD OF THREADS OR DAMAGE TO HPC REAR HUB MAY OCCUR.

(7) Determine part number of No. 3 bearing retaining nut. For engines incorporating nut PN 50A132, install work packing PN AS3209−159 into groove in HPC rear hub just forward of threads at rear of hub.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(8) Install PWA 85107 Fixture onto high pressure turbine. See Figure 307.

(a) If installed, remove rod and attached details, guide pilot, clamp and nuts from coupler. Remove nut and hydraulic cylinder. Remove plug.

(b) Remove 12 screws (307/10) securing plate (307/11) to fixture. Remove retainer (307/8) and jaws (307/4).

(c) For engines (Pre SB PW4ENG 72−176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379 ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(d) For engines (Post SB PW4ENG 72−176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72−176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(e) Loosen eight hand knobs (305/12) at center hub (307/2) of fixture and move piloting ring (307/3) rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(f) Thread three .500−13 inch eyebolts into tapped holes in rear center hub of fixture. Attach standard three cable sling to eyebolts and position fixture onto rear of high pressure turbine.

(g) Secure outer flanges of fixture to high pressure turbine case (307/1) using 26 detail screws (307/14) and spacers (307/13). Remove hoist and sling.

(h) Loosen eight hand knobs (307/12) at center hub (307/2) of fixture and allow piloting ring (307/3) to slowly seat onto turbine rear hub. Tighten eight hand knobs to secure piloting ring.

(i) Position four jaws (307/4) into center of fixture, locating lip of jaws in ID cutout of turbine hub. Lightly tighten screws (307/5) to secure jaws.

(j) Thread extension rod (307/7) into plug (307/6). Insert assembly into center of fixture and seat plug against rear of high pressure compressor shaft.

(k) Install retainer (307/8) into center of fixture to retain four jaws (307/4). Tighten four screw details of jaws.

(l) Install plate (307/11) to piloting ring (307/3) and secure with 12 screws (307/10).

(m) Thread hydraulic cylinder (307/9) into plate (307/10).

(9) Use a hoist and attach PWA 28657 Sling, PWA 88643 Sling or PWA 88673 Sling with two PWA 76156 Adapters to the trunnion spools of the fixture. Make the sling cables tight.

(10) Remove Flange M lockwire, bolts, nuts and brackets securing turbine case front flange to diffuser case. Refer to 72−00−52, Removal−20 (Task 72−00−52−020−020).

(11) Attach PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to ram. Apply hydraulic pressure to separate turbine front hub from HPC (rear hub) (approximately 0.750 inch (19.050 mm), while separating turbine case flange from diffuser case.

(a) If necessary, use PWA 102746 Puller to help when you remove the HPT from the HPC.

(12) Remove pump and hydraulic cylinder.

(13) Lift turbine and separate it from engine.

(14) Remove turbine shaft spacer from HPC rear hub. If installed, remove work packing from groove in HPC rear hub just forward of threads at rear of hub.

(15) Optional, insert PWA 85112 Retaining Fixture into ID of turbine hubs and align outer surfaces of fixture with turbine hub lock. Rotate knurled knob to secure fixture against lock.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−08

(16) Remove gasket (308/1) from front outer flange of turbine case. See Figure 308.

(17) Place the turbine front end down into the PWA 87022 Storage Stand. See Figure 309.

(18) Adjust the center plug of the storage stand to maintain the running clearance of the turbine rotors. Secure the assembly in the stand.

(19) Remove the fixture from the turbine case.

  (a) Remove 12 screws (309/1) securing plate (309/2) to piloting ring (309/10). Remove plate. Store screw details in plate.

  (b) Remove retainer (309/3), extension rod (309/4) and plug (309/5).

  (c) Loosen screws (309/7) securing jaws (309/6) to hub. Remove jaws.

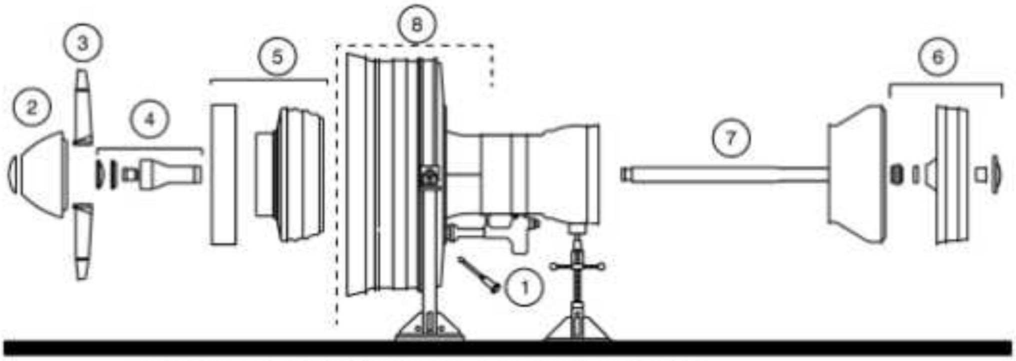
  (d) Remove screws (309/9) and spacers (309/8) securing fixture to case.

  (e) Using hoist and PWA 28657 Sling, remove fixture from case.

(20) If the turbine assembly will be moved while in PWA 87022 Stand, install PWA 86058 Retainer to prevent damage to the knife−edge seals. See Figure 310.

  (a) Put the retainer onto the rear flange of the turbine intermediate hub.

  (b) Align the boltholes and secure the outer flange of the retainer with 14 detail screws and nuts.



1. REMOVE ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).
2. REMOVE COMPRESSOR INLET CONE.
3. REMOVE STAGE 1 LPC BLADE ASSEMBLIES.
4. REMOVE LPC/LPT COUPLING.
5. REMOVE LOW PRESSURE COMPRESSOR (LPC).
6. REMOVE TURBINE EXHAUST CASE.
7. REMOVE LOW PRESSURE TURBINE (LPT).
8. TRUNNION FAN CASES THROUGH HIGH PRESSURE TURBINE (HPT) TO FRONT END DOWN.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - REMOVAL-09

Task 72-00-52-020-002-002:

1. Remove The High Pressure Turbine - Vertical (Hydraulic Wrench) - Deleted

   A. Procedure

      (1) This procedure is relocated to 72-00-52, Removal-08 (Task 72-00-52-020-002).

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − REMOVAL−20

Task 72−00−52−020−020:

1. Remove The Flange M Brackets And Hardware

   A. Equipment And Materials Necessary − None

   B. Procedure

      (1) Remove the Flange M brackets as follows: See Figure 301.

         (a) Tag and identify the flange M hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove the lockwire, nuts and bolts, which attach the brackets at Flange M.

(Task 72−00−52−020−020)

Task 72-00−52−420−001:

1. Install The High Pressure Turbine − Horizontal

NOTE: See Figure 401 for Part/Assembly Installation Procedure Sequence.

A. Prerequisites

(1) See Inspection/Check−01 (Task 72−00−52−990−001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

NOTE: The flameless torch specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25000	Wrench, Hydraulic
PWA 25672	Control, Heater (Optional To PWA 29754)
PWA 28657	Sling, Strongback
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical*
PWA 29754	Control, Heater
PWA 45419	Air Torque Multiplier* (Optional To PWA 80651) (Use With Mechanical Wrench)

Special Tools:

(CONTINUED)

	PWA 75028	Gage
	PWA 76156	Adapter (2 Required)
	PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
	PWA 85107	Fixture
	PWA 85113	Wrench
	PWA 85114	Wrench, Torque (Use With Hydraulic Wrench)
	PWA 85115	Adapter, Wrench (Use With Hydraulic Wrench)
	PWA 85116	Wrench, Torque (Use With Mechanical Wrench)
	PWA 85117	Adapter, Wrench (Use With Mechanical Wrench)
	PWA 87870	Heater
R	PWA 88703	Rod Assembly (HPT Installation) (Post SB PW4ENG 72-562) (Replaced By PWA 104153)
R	PWA 102392	Rod Assembly (HPT Installation)
R	PWA 102462	Rod Assembly (HPT Installation) (Pre SB PW4ENG 72-562) (Replaced By PWA 104281)
R	PWA 104152	Arm, Lifting (Used With PWA 102462 And PWA 104142 Rod Assemblies)
R	PWA 104153	Rod Assembly (HPT Installation) (Post SB PW4ENG 72-562)
R	PWA 104159	Arm, Lifting (Used With PWA 88703)
R	PWA 104281	Rod Assembly (HPT Installation) (Pre SB PW4ENG 72-562)
R	PWA 107013	Arm, Lifting (Used With PWA 104153 And PWA 104281 Rod Assemblies)

*See Table 401 for the mechanical wrench tool options. The table shows the correct combinations of tools to install the No. 3 bearing retaining nut.

NOTE: The high pressure turbine is stored on PWA 87022 Stand or optional PWA 85108 Stand.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-003	Compound, Antigalling (PWA 586)

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−01

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−52/1/10

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 350°F (176.7°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

CAUTION: FIRST STAGE HPT BLADES WITH THERMAL BARRIER COATING (TBC) (POST SB PW4ENG 72-466) CAN ONLY BE USED IN ENGINES WITH A TURBINE NOZZLE THAT INCORPORATES A STAGE 1 HPT (BLADE) COOLING DUCT ASSEMBLY (POST SB PW4ENG 72-466) THAT WILL SUPPLY INCREASED AIRFLOW OR DAMAGE TO THE BLADES CAN OCCUR.

CAUTION: BEFORE YOU INSTALL AND SEAT THE HPT MODULE, MAKE SURE THE NO. 3 BEARING, SPACERS AND SEALS ARE FULLY SEATED AGAINST THE HPC SHAFT SHOULDER AND EACH OTHER.

(1) If necessary, remove nuts and screws that attach PWA 86058 Retainer to the rear flange of the turbine case. Remove the retainer.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(2) Install PWA 85107 Fixture to high pressure turbine. See Figure 402.

(a) If installed, remove hydraulic cylinder and plate from pilot ring. Remove center retainer and four jaws.

(b) For engines (Pre SB PW4ENG 72−176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379 ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(c) For engines (Post SB PW4ENG 72−176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72−176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(d) Loosen eight hand knobs (402/7) at center hub (402/9) of fixture and move piloting ring rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(e) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Trunnion to front end down position.

(f) With dowel at 6 o'clock position, align boltholes and lower fixture onto rear flange of turbine case. Install 26 screws (402/6), with spacers (402/5) under screw heads, through case flange and into two outer flanges of fixture.

(g) Loosen eight hand knobs (402/7) at center hub and carefully lower pilot ring (402/8) until it contacts turbine intermediate hub. Tighten eight hand knobs to secure pilot ring.

(h) Position four jaws (402/3) into center of fixture, locating lip of jaw in ID cutout of turbine hub. Lightly tighten screws (402/4) to secure jaws.

(i) Install retainer (402/10) into center of fixture to retain jaws. Tighten screws (402/4) to secure jaws.

(j) Align bolt holes and position plate (402/2), with plug (402/1), onto piloting ring and secure with 12 screws (402/11).

(3) Make a visual examination of the HPC rear shaft and rear HPC drum to identify which features these parts have. You must do this examination so that you can select the correct installation tools for each type of HPC rear shaft and drum. Examine the inside of the shaft with a light source and a mirror. There are three types of HPC shafts and HPC rear drums, see Figure 403 (Sheet 1) and Figure 403 (Sheet 2):

- HPC rear shaft integral with HPC rear drum (one piece)

- HPC rear shaft bolted to HPC rear drum (two pieces, without shaft bore)

- HPC rear shaft with inside bore that is bolted to HPC rear drum (two pieces)

(4) After you have identified the type of HPC rear shaft and HPC rear drum that you have, make a tool selection to match the type of HPC rear shaft and rear drum as follows:

CAUTION: YOU MUST DO THE EXAMINATION OF THE HPC REAR SHAFT AND REAR DRUM BEFORE YOU SELECT THE INSTALLATION TOOLS. IF YOU USE THE WRONG

TOOLS, MUCH DAMAGE TO THE HPC SHAFT CAN OCCUR.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(5) FOR THE HPC REAR SHAFT INTEGRAL WITH HPC REAR DRUM (ONE PIECE): Install the PWA 85107 Fixture (prior to Change Letter K) or the PWA 102392 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear hub. See Figure 404 (Sheet 1) and Figure 404 (Sheet 2).

(a) If required, adjust position of guide (404/2) to allow clamp (404/1) at end of rod to rotate to horizontal position with shaft (404/4). Tighten jamnuts to lock guide in position.

(b) Remove jamnut (404/6) on end of shaft (404/4) and remove clamp (404/5).

(c) Rotate clamp (404/1) to horizontal position. Install shaft (404/4) into HPC rear hub (404/8) until clamp is allowed to tilt and touch on the conical surface in the ID of the HPC rear hub.

(d) Check the position of pilot (404/3). It should be approximately 1.0 inch (25.4 mm) from the end of the HPC rear hub (404/8).

(e) If required, remove shaft (404/4) and clamp assembly. Adjust position of pilot as necessary. Tighten jamnut to secure pilot. Reinstall shaft in HPC rear hub per previous step.

(f) Position clamp, smaller OD end first, onto shaft and secure with jamnut (404/6) to lock shaft assembly in HPC rear hub.

(g) Install the coupler (404/7), a detail of PWA 85107 Fixture, onto the end of the shaft (404/4).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(6) FOR HPC REAR SHAFT BOLTED TO HPC REAR DRUM (TWO PIECES, WITHOUT SHAFT BORE, PRE SB PW4ENG 72−562): Install the PWA 85107 Fixture (prior to Change Letter K) or the PWA 102462 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear hub. See Figure 405 (Sheet 1) and Figure 405 (Sheet 2).

R NOTE: You can install the HPT with the optional PWA
R 104281 Rod Assembly.

(a) If necessary, adjust the position of the guide (405/2) to permit the shoe (405/1) at the end of the rod to turn to the horizontal position with the rod (405/5). Tighten the jamnuts to lock the guide (405/2) in position.

(b) Remove the jamnut (405/6) on the end of the rod (405/5) and remove the rod clamp (405/4).

(c) Turn the shoe (405/1) to the horizontal (parallel to rod) position with the push/pull control (405/9) and lock in this position. Install the rod assembly, shoe end first, into the HPC rear hub (405/8) as for as it will go.

(d) Unlock and turn the shoe (405/1) with the push/pull control (405/9) until the shoe (405/1) is in the vertical position (90° to rod). Pull the rod assembly rearward until the shoe (405/1) touches the conical surface in the ID of the HPC rear hub (405/8).

(e) The pilot (405/3) should be approximately 1.0 inch (25.4 mm) from the end of the HPC rear shaft (405/8).

(f) If necessary, remove rod (405/5) and shoe (405/1). Adjust the position of the pilot (405/3) as necessary. Tighten the jamnut to secure the pilot (405/3). Install the rod (405/5) and shoe (405/1) in the HPC rear hub again (405/8).

(g) Position rod clamp (405/4), smaller OD end first, onto the shaft. Tighten jamnut (405/6) to lock rod assembly in the HPC rear hub (405/8).

(h) Install the coupler (405/7), a detail of the PWA 85107 Fixture, onto the end of the shaft (405/8).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(7) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72-562): Install the PWA 88703 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear drum, rear disk. The detail hydraulic cylinder, plug, and plate are removed from the rear end of the PWA 85107 Fixture. See Figure 406 (Sheet 1) and Figure 406 (Sheet 2).

R NOTE: See the following step to install the HPT with
R the optional PWA 104153 Rod Assembly.

(a) Attach the detail shoulder eyebolt and coupling of the PWA 85107 Fixture to the rear end of the detail shaft of the PWA 88703 Rod Assembly. Attach an overhead hoist to the eyebolt and lift the PWA 88703 Rod Assembly.

(b) Turn back the rear detail hex nut (406/6) of the shaft until the nut covers the rear red mark on the shaft.

(c) Pull the two detail push-pull controls (406/9) and turn the handles to lock the controls in the retracted position.

(d) Put the front end of the PWA 88703 Rod Assembly into the HPC rear shaft and push the rod assembly forward as far as it will go.

(e) Turn the handles of the push-pull controls (406/9) to unlock the controls and open the two detail feet (406/1).

(f) Carefully pull the rod assembly rearward to engage the detail feet (406/1) against the front face of the HPC rear drum rear flange.

(g) Turn the rear detail hex nut (406/6) on the shaft forward until it touches the detail shaft clamp (406/5). Make sure the forward red mark is visible. If it is not, turn the hex nut (406/6) rearward and shake the rod assembly to get it to properly engage against the HPC rear drum rear flange. Turn the rear detail hex nut (406/6) on the shaft forward until it touches the detail shaft clamp (406/5). Make sure the forward red mark is visible.

(h) Install the coupler (406/7), a detail of the PWA 85107 Fixture, onto the end of the shaft.

R (8) For HPC rear shaft with inside bore that is bolted to
R HPC rear drum (two pieces, post SB PW4ENG 72−562): PWA
R 104153 Rod Assembly. See Figure 406 (Sheet 3) and
R Figure 406 (Sheet 4).

R (a) Put the shaft (406/2), with the foot (406/1), and
R shaft clamp (406/3) assembly on a workbench.

R (b) Turn back the locking nut (406/4) on the shaft
R until the nut covers the rear red mark on the
R shaft.

R (c) Insert the dowel pin (T−handel) (406/6) into the
R guide rod (406/5).

R (d) Pull and turn the dowel pin (T−handle) (406/6) 1/4
R turn to hold the feet in the retracted (closed)
R position.

R (e) Attach the PWA 107013 Lifting Arm (called Arm)
R to the rear end of the detail shaft of the Rod
R Assembly. See Figure 406 (Sheet 4).

R 1 Thread the detail cap (406/7) of the Arm into
R the Rod Assembly.

R 2 Operate the hoist to move the armhole in the
R Arm over the cap detail and rod assembly and
R attach with the detail nut ring (406/8).

R 3 Operate the hoist to lift the Arm and Rod
R Assembly and at the same time turn the hand
R knob to balance the lift arm and Rod Assembly.

R 4 Position the Rod Assembly so that it aligns
R with the HPC rear shaft.

R (f) Put the Rod Assembly into the HPC rear shaft and
R push the rod assembly forward as far as it will
R go.

R (g) Look into the shaft opening to make sure that the
R feet have the necessary clearance to open.

R (h) Push the guide rod (406/5) forward to open the
R feet (406/1).

R (i) Carefully pull the rod assembly rearward until the
R feet (406/1) touch the front face of the HPC rear
R drum.

R (j) Engage the shaft clamp (406/3) into the shaft
R (406/2) ID and lock the shaft clamp in position
R with the locking nut (406/4).

R (k) Make sure that the nut overlaps or gets below the
R red mark on the shaft. If not, loosen the locking
R nut (406/4) and carefully shake the rod assembly
R lightly to re−adjust the feet (406/1).

R (l) Remove the dowel pin (T−handel) (406/6) from the
R guide rod and remove the lifting tool.

R (m) Remove the PWA 107013 Lifting Arm from the Rod
R Assembly.

R 1 Carefully change the hoist and lift Eye to the
R hole marked "LIFT TOOL ONLY".

R 2 Remove the detail nut (406/8).

R 3 Operate the hoist to remove the Lift Arm from
R the Rod Assembly.

R 4 Remove the detail cap (406/7) from the shaft
R (406/2).

R (n) Install the detail coupler (406/7) to the shaft
R (406/2).

(9) Lubricate the ID snap diameters and splines of the HPC shaft with Antigalling Compound P06−003. See Figure 407.

(10) Position PWA 87870 Heater onto a standard workbench.

(11) If necessary, remove the protective cover positioned over the turbine blades. Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Lift high pressure turbine from stand and position it on the heater.

CAUTION: THE THERMOCOUPLE MUST TOUCH THE END OF THE TURBINE SHAFT OR YOU CAN HEAT THE PART TOO MUCH.

(12) Connect PWA 29754 Heater Control to the heater. Heat the turbine hub to 270° − 350°F (132.° − 177.°C) maximum. After the hub is heated, remove the heater and controller.

NOTE: After you heat the HPT hubs, do steps (12) through (19) in rapid succession.

(13) Use the hoist to lift turbine from the heater. Trunnion the turbine to the horizontal position, and put it to the rear of the engine.

(14) Install the gasket onto the front outer flange of the turbine case. See Figure 408.

(15) If applicable, locate the optional PWA 85112 Retaining Fixture in ID of turbine between front and rear turbine hubs. Rotate knurled nut to retract fixture. Remove fixture from hubs.

(16) Move turbine into position, aligning turbine front hub splines with HPC (rear hub) splines. Move assembly forward to engage splines. Continue moving assembly forward until stopped at tight fit.

NOTE: Since high pressure turbine rotor cannot be rotated, it may be necessary to rotate high pressure compressor rotor to align splines.

(17) Put hydraulic cylinder (409/2) over coupler (409/5) and against plug (409/6) in the center of fixture (409/1). Attach the hydraulic cylinder with spacer (409/3) and flanged nut (409/4). See Figure 409.

(18) Connect PWA 29389 Pump or PWA 3755 Pump, with PWA 75028 Gage to hydraulic cylinder.

(19) Install ten workbolts and nuts evenly spaced through turbine front case and diffuser case, Flange M, from rear to front.

CAUTION: YOU MUST LOOSEN THE EIGHT HAND KNOBS (409/7), THAT HOLD THE PILOTING RING (402/8), SO THAT THE RING MOVES FREELY AGAINST THE TURBINE INTERMEDIATE HUB BEFORE YOU APPLY A LOAD OF 38,500 − 41,500 LBF. (171,256.5 − 184,601.2 N) FOR THE SECOND TIME OR DAMAGE TO THE ENGINE CAN OCCUR.

(20) (Reference 976) Seat turbine by tightening workbolts while actuating hydraulic pump to apply load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N). Release hydraulic pressure. Loosen eight hand knobs (409/7). Apply load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 5,332 − 5,747 psig (36,762.8 − 39,624.2 kPa) will apply a load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 2,905 − 3,132 psig (20,029.3 − 21,594.4 kPa) will apply a load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

(21) Release the hydraulic load. Remove nut (410/7), spacer (410/6), and hydraulic cylinder (410/5). Remove the screws (410/4) and plate (410/3). Remove retainer (410/2). Loosen the detail screws and remove four jaws (410/1) from the ID of the fixture. See Figure 410.

(22) Lubricate the axial faces of the turbine shaft spacer with Antigalling Compound P06−003. See Figure 411.

(23) Install turbine shaft spacer (410/9) onto the HPC rear hub.

(24) Lubricate the threads and splines of the No. 3 bearing retaining nut with Antigalling Compound P06−003. See Figure 411.

CAUTION: THE NO. 3 BEARING NUT MUST BE SILVER PLATED PRIOR TO EACH HIGH PRESSURE TURBINE INSTALLATION OR DAMAGE TO THE MATING PARTS CAN OCCUR. THE NUT CAN BE REMOVED AND RETORQUED FOR EACH HIGH PRESSURE TURBINE INSTALLATION A MAXIMUM OF THREE TIMES BEFORE REQUIRING REPLATING.

CAUTION: IF THE NUT IS REMOVED AFTER AN ENGINE RUN, IT MUST BE REPLATED.

(25) Thread the No. 3 bearing retaining nut (410/8) to the HPC rear hub. Hand tighten the nut. Use PWA 85113 Hand Wrench. Leave the hand wrench in position. Install plate (410/3) and secure with 12 screws (410/4). Install the hydraulic cylinder (410/5) over the coupler (410/10) and seat against the plug in the center of the plate (410/3). Attach the hydraulic cylinder with spacer (410/6) and nut (410/7).

NOTE: Do not install retainer or jaws.

CAUTION: MAKE SURE THE HYDRAULIC PRESSURE IS KEPT WHILE YOU TIGHTEN THE NUT OR THE NUT WILL NOT SEAT CORRECTLY AND DAMAGE TO THE ENGINE CAN OCCUR.

(26) (Reference 976) Actuate the hydraulic pump and apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0 N). Use the PWA 85113 Hand Wrench to tighten the nut until the nut is seated on the hub.

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 8,310 − 8,725 psig (57,295.4 − 60,156.8 kPa) will apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 4,528 − 4,755 psig (31,219.5 − 32,784.6 kPa) will apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0 N).

(27) Release load and remove rod assembly.

(a) Remove hydraulic pump, nut (410/7), spacer (410/6), and hydraulic cylinder (410/5). Remove screws (410/4) and plate (410/3).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(b) Remove bolts securing PWA 85107 Fixture to the turbine case rear flange. Remove fixture, sling, and hoist.

(c) FOR THE HPC REAR SHAFT INTEGRAL WITH HPC REAR DRUM (ONE PIECE): Remove the PWA 102392 Rod Assembly as follows: See Figure 404.

1 Carefully remove coupler (404/7) and clamp (404/5) from shaft (404/4).

2 Turn clamp (404/1) horizontal and carefully remove rod assembly from HPC rear hub (404/8).

(d) FOR HPC REAR SHAFT BOLTED TO HPC REAR DRUM (TWO PIECES, WITHOUT SHAFT BORE, PRE SB PW4ENG 72-562): Remove the PWA 102462 Rod Assembly as follows: See Figure 405.

1 Carefully remove coupler (405/7) and rod clamp (405/4) from rod (405/5).

2 Use push/pull control (405/9) to turn shoe (405/1) to the horizontal position.

3 Carefully remove rod assembly from the HPC rear hub (405/8).

(e) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72-562): Remove the PWA 88703 Rod Assembly as follows: See Figure 406.

1 Carefully remove coupler (406/7).

2 Turn detail rear hex nut (406/6) on the shaft rearward until it covers the rear red mark on the shaft.

3 Carefully push the rod assembly forward as far as it will go.

4 Turn the two detail handles of the push/pull controls (406/9) to unlock the two detail feet (406/1) and pull the control handles rearward to disengage the feet.

5 Turn the push/pull control handles (406/9) to lock the feet (406/1) in the retracted position.

6 Carefully pull the PWA 88703 Rod Assembly rearward until the fixture is removed from the HPC rear shaft (406/8).

R (f) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72−562): Remove the PWA 104153 Rod Assembly as follows: See Figure 406 (Sheet 3) and Figure 406 (Sheet 4).

R 1 Carefully remove the coupler (406/7). See Figure 406 (Sheet 4).

R 2 Attach the PWA 107013 Lifting Arm to the rear end of the shaft (406/2). See Figure 406 (Sheet 3) .

R a Thread the detail cap (406/7) of the Lifting Arm into the shaft (406/2).

R b Operate the hoist to move the armhole in the Lifting Arm over the detail cap (406/7) and attach the Lifting Arm to the shaft (406/2) with the detail nut ring (406/8).

R 3 Turn detail rear locking nut (406/4) on the shaft rearward until it covers the rear red mark on the shaft.

R 4 Insert the dowel pin (T−handel) (406/6) into the guide rod (406/5).

R 5 Push and turn the dowel pin (T−handle) (406/6) 1/4 turn to hold the feet in the extended position.

R 6 Turn the two detail handles of the push/pull controls (406/9) to unlock the two detail feet (406/1) and pull the control handles rearward to disengage the feet.

R 7 Turn the push/pull control handles (406/9) to lock the feet (406/1) in the retracted position.

R 8 Carefully pull the Rod Assembly rearward until the fixture is removed from the HPC rear shaft.

R 9 Remove the Lifting arm from the Rod Assembly.

(28) For operators that use the mechanical wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 85116 Wrench into ID of No. 3 bearing retaining nut (412/7) engaging splines of wrench with splines of nut. See Figure 412.

(b) Install PWA 85117 Adapter to turbine intermediate hub (412/6). See Figure 412.

1 Loosen hex nuts (412/5) securing eight clamps (412/4). Slide clamps in slots in opposite direction that arrow is pointing and secure clamps with hex nuts.

2 Connect hoist to lifting eye on adapter.

3 Using hoist, position adapter to rear of PWA 85116 Wrench.

4 Rotate turbine rotor as required to position clamps (412/4) through slots (412/1) between lugs in turbine intermediate hub.

5 Align teeth of adapter with slots between lugs of hub. Loosen hex nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and insert pins (412/3) into holes in base of adapter. Tighten hex nuts to secure clamps.

NOTE: Plate detail of clamp points to direction that clamp feet are facing.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85116 Wrench. Align anti−torque pins in wrench with bushings in PWA 85117 Adapter and seat wrench on adapter. See Table 401 for mechanical wrench options. See Figure 413.

NOTE: Wrenches may be actuated using air torque multipliers to speed up removal of nut. See Table 401.

PWA Mechanical Wrench	PWA Torque Multiplier
PWA 29614	PWA 45419 or PWA 80651

Mechanical Wrench Options
Table 401

(29) For operators that use the hydraulic wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 85114 Wrench into ID of No. 3 bearing retaining nut (414/5) engaging splines of wrench with splines of nut. See Figure 414.

(b) Install PWA 85115 Adapter to turbine intermediate hub.

1 Loosen wing nuts securing eight clamps (414/3). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with wing nuts.

2 Install eyebolt into threaded hole at top of adapter and connect hoist to eyebolt.

3 Using hoist, position adapter to PWA 85114 Wrench and onto rear of HPT.

4 Rotate turbine rotor as required to position clamps (414/3) through slots between lugs in turbine intermediate hub (414/6).

5 Align 16 teeth of adapter with slots between lugs of turbine intermediate hub. Loosen wing nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and secure with wing nuts.

NOTE: Dowel pin (414/4) in stud detail of clamp points in direction that clamp feet are facing.

(c) Use a hoist and applicable sling to lift the PWA 25000 Hydraulic Wrench. Find the correct direction to turn the drive spline of the wrench. Refer to the PWA 29178 Instruction Decal on the hydraulic wrench to get the position of the shifting mechanism to cause the drive spline to turn in the tighten direction. See Figure 415.

NOTE: PWA 28669 Cart can be used to store and transport PWA 25000 Wrench.

(d) Connect PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench. Operate the wrench to make sure that the wrench turns in the tighten direction.

(e) Align splines and position PWA 25000 Wrench onto PWA 85114 Wrench. Move wrench forward and engage keys of PWA 85115 Adapter with keyways in PWA 25000 Wrench. See Figure 415.

(f) Use the selector to operate the wrench (in the following step). As the drive spline turns, look at the travel indicator. When the travel indicator reaches its maximum travel, use the selector control valve to let the wrench ratchet return. Repeat this procedure as necessary (in the following step) until the nut is tightened.

(30) (Reference 976) Actuate wrench to torque No. 3 bearing retaining nut.

CAUTION: THE NUT MUST NOT MOVE WITH THIS TORQUE RANGE. IF THE NUT MOVES, THE STACK IS NOT SEATED AND THIS PROCEDURE FROM STEP (16) ONWARD MUST BE DONE AGAIN. IF THE NUT DOES NOT MOVE, CONTINUE WITH THE ANGLE OF TURN. IF THE NUT MOVES AFTER

THE SECOND ATTEMPT OF STEPS (16) AND ON, PROCEED TO THE ANGLE OF TURN.

(a) Torque the nut to 6000 − 10000 lb−in. (677.909 − 1129.848 N.m) to make sure the stack is tight.

(b) Set angle of turn scale to 0 and apply 90 − 94 degrees angle of turn.

(31) After you do the angle of turn, measure the final torque necessary to move the nut in the forward direction. This can be done with a suitable hand torque wrench with the appropriate multiplier on the mechanical wrench. The minimum torque necessary to make sure of the correct loading is 75000 lb−in. (8473.860 N.m). If the final torque is less, continue the angle of turn up to an additional 20 degrees. Use only the additional angle of turn necessary to get the 75000 lb−in. (8473.860 N.m) final torque. If more than the additional 20 degree angle of turn is necessary to get the 75000 lb−in. (8473.860 N.m) final torque then you must do the procedure again from step (16) onward.

(32) Remove wrenches from turbine hub.

(33) Install No. 3 bearing retaining nut lock. See Figure 416.

(a) Install one retaining ring lock (416/2) into groove in ID spline of No. 3 bearing retaining nut (416/3).

(b) Align lugs on front of No. 3 bearing nut lock (416/1) with slots in HPC rear hub while mating splines of nut lock with No. 3 bearing retaining nut.

(c) Install second retaining ring lock (416/2) into groove in ID spline of retaining nut.

(34) Remove all the unwanted antigalling compound from the nut and the hub.

(35) Install Flange M hardware as follows. Refer to 72-00-52, Installation-20 (Task 72-00-52-420-020).

NOTE: Leave protectors on the 2nd stage turbine airseal land and 2nd stage blade trailing edges until low pressure turbine is installed.

E. Postrequisites

(1) Install The External Plumbing. Refer to 72-00-52, Installation-03 (Task 72-00-52-420-003).

(2) Install The Low Pressure Turbine. Refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

(3) Test the engine. Refer to the Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−02

Task 72−00−52−420−001−002:

1. Install The High Pressure Turbine − Horizontal (Hydraulic Wrench) − Deleted

   A. Procedure

      (1) This procedure is relocated to 72−00−52, Installation−01 (Task 72−00−52−420−001).

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−03

Task 72-00−52−420−003:

1. Install The External Plumbing After The High Pressure Turbine Installation

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
R	P05−292	Ferrule, Safety Cable (Optional)

B. Procedure
See Figure 401.

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(1) Install the EEC PT4.95 tube assembly (AS27) as follows.

(a) Remove covers. Install the tube to the tube nut forward of Flange M at approximately 9 o'clock position.

(b) Install the clamps, bolt, threads lubricated with Engine Oil P03−001, and nut to the diffuser case bracket at approximately 9 o'clock position.

(c) Install the clamps, bolt, threads lubricated with Engine Oil P03−001, and nut that attach the tube to the adjacent tube forward of Flange M at approximately 8 o'clock position.

(d) Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the tube nut to the tube coupling to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−04

Task 72−00−52−450−001:

1. Install Turbine Case Cooling (TCC) Air Valve (HPT)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

B. Procedure
See Figure 401 and Figure 402.

(1) Move the valve, with flow arrows pointing downward, into position between the upper and lower support brackets while you align the bolt holes.

(2) Place the upper support link outward into position at the upper flange of the valve and attach the upper flange of the valve and the support link with five bolts, threads lubricated with Engine Oil P03−001, (longer bolt at support link location) to the upper support bracket.

(3) Secure lower flange of valve with Engine Oil P03−001, lubricated bolts and nuts to lower support bracket.

NOTE: Do not install bolt and nut at lower flange support link location. These are installed during the LPT TCC valve installation.

(4) Torque all bolts securing valve flanges and braces to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) If not already installed, install a new bearing and bushing in the idler arm as follows:

(a) Put the idler arm in a preheated 250°F (121.1°C) oven for approximately 15 minutes.

(b) Put the new bushing in a box of dry ice for approximately 15 minutes.

CAUTION: DO NOT TOUCH THE HOT IDLER ARM OR THE DRY ICE AND BUSHING WITH YOUR FINGERS. WEAR GLOVES AND PROTECTIVE CLOTHES. THE HOT PARTS AND DRY ICE CAN BURN YOUR SKIN.

(c) Working quickly, remove the idler arm from the oven with gloves. Put it on a clean work bench with the large diameter of the bearing hole up.

(d) Quickly install the new bearing in the idler arm bearing hole. To seat the bearing, lightly tap the bearing with a nylon drift and a mallet.

(e) Remove the bushing from the dry ice with gloves and quickly install it in the other idler arm hole. Install the bushing with the flange side up. If necessary, use a work bolt, washers and a nut to seat the bushing in the idler arm.

(f) To attach the bearing to the idler arm, install the retaining ring in the retaining ring groove of the idler arm.

(6) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 75−74 only) Install the HPT TCC air shutoff valve idler arm to the HPT TCC air shutoff valve lever arm with a spacer between the two arms. Attach with a nut, threads lubricated with Engine Oil P03−001. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Do not attach cable or push−pull rod to valve at this time. See 72−00−53, Installation−06 Task 72−00−53−450−004 for the assembly of the cable and rod.

(7) (Pre SB PW4ENG 75−136) Install the HPT TCC air shutoff valve idler arm to the HPT TCC air shutoff valve lever arm. Attach with a nut, threads lubricated with Engine Oil P03−001. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Do not attach cable or push−pull rod to valve at this time. See 72−00−53, Installation−06 Task 72−00−53−450−004 for the assembly of the cable and rod.

(8) (Post SB PW4ENG 75−136) Install the HPT TCC air shutoff valve idler arm to the HPT TCC air shutoff valve lever arm. Attach with a bearing sleeve assembly, threads lubricated with Engine Oil P03−001. Torque the bearing sleeve assembly to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Do not attach cable or push−pull rod to valve at this time. See 72−00−53, Installation−06 Task 72−00−53−450−004 for the assembly of the cable and rod.

C. Postrequisites

(1) Install LPT turbine case cooling (TCC) air valve by 72−00−53, Installation−07 Task 72−00−53−450−001.

(2) Rig TCC system by 72−00−00, Special Procedures−06 Task 72−00−00−830−004 or Special Procedures−11, Task 72−00−00−830−005 as applicable.

(3) Test engine by Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-05

Task 72-00-52-450-002:

1. Install Turbine Case Cooling Manifold (Collector)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)

B. Procedure
See Figures 401 through 403.

(1) Position turbine case cooling manifold (collector) (401/2) onto TCC valve support (401/9) located on turbine case at 2:30 o'clock position. Secure manifold (collector) to bracket and turbine case cooling air shutoff valve (HPT) (401/1) using bolts, threads lubricated with Engine Oil (P03-001), and nuts (401/10) at five locations. See Figure 401.

(2) Align boltholes in bracket (401/12) with two inboard boltholes of manifold (collector) flanges and lug on turbine case. Using bolts, threads lubricated with Engine Oil (P03-001), secure bracket to lug on turbine case with one bolt and nut (401/11) and secure to support (401/9) with two bolts and nuts (401/13). Torque all eight bolts to secure manifold (401/2) and bracket (401/12) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) Using screw (401/3), threads lubricated with Engine Oil (P03-001), and nut (401/6), install clamp (401/5) under bracket detail of manifold (401/2). Handtighten bolt.

(4) Install spacer (401/7) into clamp (401/5). Secure clamp to bracket on Flange M using bolt (401/8), threads lubricated with Engine Oil (P03-001), and nut (401/4). Torque bolt (401/8) to 85 - 95 lb-in. (9.604 - 10.734 N.m). Torque previously installed bolt (401/3) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(5) Slide upper and lower turbine case cooling manifolds around case as required to install manifolds onto tube details of manifold (collector) (402/1). Align bolt holes and secure manifolds with eight bolts (402/2), threads lubricated with Engine Oil (P03-001). Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 402.

(6) Torque four bolts (402/1) at six locations to secure four manifold clamps (402/2) to brackets on turbine case at approximately 2, 4:30, 6, 8:30, 10:30 and 11:30 o'clock position. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 403.

C. Postrequisites

(1) Install the lower right turbine cooling tube per Installation-07 (Task 72-00-52-450-004).

(2) Install EEC thermocouple and airframe cable (W6) as required per 72-00-54, Installation-09 (Task 72-00-54-450-006).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-52-450-003:

1. Install Turbine Case Cooling Manifolds (HPT)

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

B. Procedure
See Figure 401, Figure 402 and Figure 403.

(1) Remove protective closures.

(2) Position rear upper and lower HPT cooling air manifolds around case with open ends toward collector. Do not secure at this time.

(3) Reinstall HPT rear support brackets (previously removed for access) to Flange N brackets with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Reinstall LPT TCC front support brackets to Flange N previously removed for access to HPT rear upper, and lower cooling air manifolds and secure with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque Flange N nuts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(5) Attach the Flange N the LPT support brackets to the LPT bridge brackets with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

NOTE: Bolt and nut at approximately the 8 o'clock position holds clamp supporting HPT tube.

(6) Position upper and lower rear HPT cooling air manifolds (AC21) through (AC28) around case and engage ends to HPT collector. Secure to collector with bolts, threads lubricated with Engine Oil P03−001 and tighten handtight only.

(7) Install clamps to brackets on rear upper and lower HPT cooling manifolds and secure to support brackets at Flange N with bolts, threads lubricated with Engine Oil P03−001, and nuts, handtight only.

(8) Install two center, upper HPT cooling air manifolds to engine and engage open ends to collector. Secure manifolds to collector with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(9) Install and secure upper bridge brackets to support brackets on Flanges M and N with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(10) Secure two upper center TCC manifolds to upper (three) bridge brackets with bolts, threads lubricated with Engine Oil P03−001, clamps, and nuts, handtight only.

(11) Install two center, lower HPT cooling air manifolds to engine and engage open ends to collector. Secure manifolds to collector with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(12) Install and secure lower bridge brackets to support brackets on Flanges M and N with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(13) Secure two lower center TCC manifolds to lower (three) bridge brackets with bolts, threads lubricated with Engine Oil P03−001, clamps, and nuts, handtight only.

(14) Install front upper and lower cooling air manifolds to engine engaging open ends with detail tubes of collector. Secure manifolds to collector with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(15) Install clamps to upper and lower cooling air manifold brackets and secure with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-06

(16) Torque bolts securing HPT cooling air tubes as follows:

(a) Torque bolts securing upper and lower HPT cooling manifolds to collector to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(b) Torque bolts securing bridge brackets to support brackets on Flanges M and N to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque bolts securing front and rear cooling air manifolds to support brackets to 36 - 40 lb-in. (4.067 - 4.519 N.m).

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(17) Install (rear) EEC PT4.95 pressure tube assembly (AS02) as follows.

(a) Remove protective closures from the tube fittings.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Secure the tube nut to a tee at approximately the 6 o'clock position and rearward of Flange P (Pre SB PW4ENG 72-134).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Secure the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P (Post SB PW4ENG 72-134).

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Attach the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P.

(e) Secure the tube nut to the tube coupling at approximately the 8 o'clock position and rearward of Flange N.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of a bolt with Engine Oil P03-001. Secure the tube with a clamp, bolt, and nut to the bracket on Flange P at approximately the 7 o'clock position. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m) (Pre SB PW4ENG 72-134).

(g) Torque tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(18) Install (rear) No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Install oil vent tube to adapter, threads
R lubricated with Antiseize Paste P06-054, on
exhaust case at approximately 7 o'clock position,
and secure tube nut to tube adapter, threads
R lubricated with Antiseize Paste P06-054, rearward
R of Flange M handtight only. Remove unwanted
R paste.

(b) Install clamp to tube and secure to bracket on Flange N with bolt, threads lubricated with Engine Oil P03-001, and nut. Tighten handtight only.

(c) Lubricate the threads of the bolts with Engine Oil P03-001, and install clamps to the tube and adjacent PT4.95 tube assembly. Secure the clamps on the tubes to brackets on Flange P with the bolts and nuts, and tighten by hand.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of the bolt with Engine Oil P03-001. Secure tube to the adjacent PT4.95 tube assembly with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P (Post SB PW4ENG 72-134).

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lubricate the threads of the bolt with Engine Oil P03-001. Secure the tube to the adjacent PT4.95 tube assembly with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P.

(f) Install clamp to tube and secure to adjacent tube between Flange N and Flange P with bolt, threads lubricated with Engine Oil P03-001, and nut handtight only.

(g) Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(h) Torque tube nuts (both ends) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(19) (Pre SB PW4ENG 79-75) Install (rear) No. 4 bearing oil scavenge tube assembly (LR06) as follows.

(a) Install rear scavenge tube, elbow threads
R lubricated with Antiseize Paste P06-054, to tube nut on internal tube at approximately 10 o'clock position on exhaust case and to adapter, threads
R lubricated with Antiseize Paste P06-054, of front scavenge tube at Flange M at approximately the 7
R o'clock position, handtight only. Remove unwanted
R paste.

(b) Install clamps to tube and secure to brackets on Flanges P and N with bolts, threads lubricated with Engine Oil P03-001, and nuts, handtight only.

(c) Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque tube nut at exhaust case connection to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(e) Torque tube nut at Flange N connection to 475 - 525 lb-in. (53.668 - 59.317 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) (Reference 2151) Position spray shield to inboard side of Flange M connection and secure forward end with hose clamp. Torque clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(g) Install clamp to rear of spray shield over tube and secure to Flange M bracket with bolt, threads lubricated with Engine Oil P03-001, and nut. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(20) (Post SB PW4ENG 79-75) Install (rear) No. 4 bearing scavenge tube assembly (LR06) as follows.

(a) Install rear scavenge tube, threads lubricated
R with Antiseize Paste P06−054, to exhaust case
internal tube nut at approximately 10 o'clock
position, and to the tube (LR05) coupling forward
of Flange M at approximately 7 o'clock position,
R handtight only. Remove unwanted paste.

(b) Install loop clamp bracket on Flange M bracket at approximately 7 o'clock with bolts lubricated with Engine Oil P03−001, handtight only. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Secure tube to loop clamp bracket on Flange M bracket with one clamp and bolt, lubricated with Engine Oil P03−001, handtight only. Torque clamp bolt to 27 − 30 lb−in. (4.067 − 4.519 N.m).

(d) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flange N and P brackets. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nut at exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Position tube shield to inboard side of Flange M connection and secure forward end of shield with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(21) Install (rear) No. 4 bearing oil pressure tube assembly (LP16) as follows.

(a) Install pressure tube to No. 4 last chance oil strainer housing, threads lubricated with Engine Oil P03−001, on exhaust case at approximately 11 o'clock position and to adapter, threads lubricated with Engine Oil P03−001, forward of Flange M at approximately the 10 o'clock position handtight only.

(b) Install clamps to tube and secure to Flanges P, N, and M brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(c) Install clamps, bolt, threads lubricated with Engine Oil P03−001, spacer, and nut securing tube to adjacent scavenge tube rearward of Flange N handtight only.

(d) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nuts (both ends) to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nuts.

(f) (Reference 2151) Install spray shield to inboard side of forward tube connection and secure in place with clamps. Torque clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(g) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2151) (Pre SB PW4ENG 79−54) Install spray shield to inboard side of rear tube connection and secure with clamp. Torque clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(h) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2151) (Post SB PW4ENG 79−54) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Secure the forward end of the shield to the bracket on the diffuser case with a clamp, bolt lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Secure the rear of the shield with a hose clamp and torque to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Reference 2151) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Attach the forward end of the shield to the bracket on the diffuser case with a clamp and bolt, threads lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Attach the rear of the shield with a hose clamp and torque to 15 − 18 lb−in. (1.695 − 2.034 N.m).

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−06

C. Postrequisites

(1) Install EEC thermocouple and airframe cable (W6) as necessary by 72−00−54, Installation−09 Task 72−00−54−450−006−A00.

(2) Test engine by Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72-00-52-450-004:

1. Install Turbine Cooling Tubes

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	75-24-00	2	5
Gasket	1	75-24-00	2	95
Gasket	1	75-24-00	3	25
Gasket	1	75-24-00	3	125
Seal Plate	1	75-24-00	2	1
Seal Plate	1	75-24-00	2	90
Seal Plate	1	75-24-00	3	20
Seal Plate	1	75-24-00	3	120

B. Procedure

(1) Install turbine vane cooling air duct (upper right) (AP01) as follows. See Figure 401.

(a) Remove protective closures.

(b) Secure new gasket in place on HPC case boss using Paraffin Wax (P05-059) at approximately the 2 o'clock position.

(c) (Pre SB PW4ENG 72-315) Secure new gasket in place on HPT pad with Paraffin Wax (P05-059) at approximately the 1 o'clock position.

(d) (Post SB PW4ENG 72−315) Install a new metering orifice seal plate, convex side outward, in place to the pad at approximately the 1 o'clock position on the HPT case with Paraffin Wax (P05−059).

(e) Position cooling air duct to above pads and secure with bolts, threads lubricated with Engine Oil (P03−001), with larger bolts at the rear flange and bracket at front flange handtight only.

(f) Install clamp over cooling air duct at support on diffuser case. Secure with bolts, threads lubricated with Engine Oil (P03−001). Torque bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts.

(g) Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts.

(2) Install turbine vane cooling air duct (lower right) (AP02) as follows. See Figure 401.

(a) Remove protective closures.

(b) Install a new gasket in position on the flange of the turbine vane and blade cooling air valve with Paraffin Wax (P05−059).

(c) Attach a new gasket or metering orifice seal plate in position on the HPT pad with Paraffin Wax (P05−059) at approximately the 4 o'clock position.

(d) Install the cooling air duct to the HPT boss and to the rear of cooling air valve and hold in position with bolts, threads lubricated with Engine Oil (P03−001), handtight only.

(e) Position clamp over cooling air duct at bracket on Flange M and secure with bolts, threads lubricated with Engine Oil (P03−001), and nuts. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.735 N.m), then retorque to same limit until torque is maintained. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts at the rear flange of the duct.

(3) Install turbine vane cooling air duct (upper left) (AP04) as follows. See Figure 402.

(a) Remove protective closures.

(b) Secure a new gasket in place on flange of turbine cooling air valve with Paraffin Wax (P05−059).

(c) Install a new metering orifice seal plate (Engines without SB PW4ENG 72−315 or SB PW4ENG 75−57) or a gasket (Engines with SB PW4ENG 72−315 or SB PW4ENG 75−57) in place on the HPT pad with Paraffin Wax (P05−059) at approximately the 9 o'clock position.

(d) Position cooling air duct to HPT boss and to rear of cooling air valve and secure with bolts, threads lubricated with Engine Oil (P03−001), larger bolts at rear flange handtight only.

(e) Position clamp to cooling air duct at bracket on diffuser case and secure with bolts and nuts lubricated with Engine Oil (P03−001). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque bolts at forward flange to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to same limit without loosening until torque is maintained. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts at the rear flange of the duct.

(4) Install turbine vane cooling air duct (lower left) (AP03) as follows. See Figure 402.

(a) Remove protective closures.

(b) Secure a new gasket in place on HPC case boss with Paraffin Wax (P05−059) at approximately 9 o'clock position.

(c) Install a new metering orifice seal plate, convex side outward, in place to the pad at approximately the 7 o'clock position on the HPT case with Paraffin Wax (P05−059) (Engines with SB PW4ENG 72−315 and without SB PW4ENG 75−57).

(d) Install a new gasket in place on the HPT pad with Paraffin Wax (P05−059) at approximately the 7 o'clock position (Engines without SB PW4ENG 72−315 and with SB PW4ENG 75−57).

(e) Position cooling air duct to above pads and secure rear of duct with bolts, threads lubricated with Engine Oil (P03−001), larger bolts at rear flange handtight only.

(f) Align boltholes of bracket (attached to No. 4 bearing oil pressure tube) with boltholes in front flange of duct. Secure front flange and bracket with bolts, threads lubricated with Engine Oil (P03−001), handtight only.

(g) Position clamp over duct at bracket on diffuser case boss and secure to bracket with bolts, threads lubricated with Engine Oil (P03−001), an nuts. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(h) Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292) to the bolts.

(i) Torque the clamp bolt that attaches the No. 4 bearing oil pressure tube to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(j) Install a bolt, threads lubricated with Engine Oil (P03−001), and a nut to the clamp that attaches the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air tube. Adjust the spray shield on the inboard side of the manifold and torque the bolt clamp to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(k) For engines equipped, install gasket to borescope plug groove. Install plug to rear elbow and engage end of plug into inner hole to seat. Install three bolts, threads lubricated with Engine Oil (P03−001). Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-07

Task 72-00-52-450-005:

1. Install Turbine Cooling Tubes

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-24-00/2/5
Gasket	1	75-24-00/2/95
Gasket	1	75-24-00/3/25
Gasket	1	75-24-00/3/125
Seal Plate	1	75-24-00/2/1

Seal Plate	1	75-24-00/3/20
Seal Plate	1	75-24-00/3/120

B. Procedure

(1) Install the (upper right) turbine vane cooling air duct (AP01) as follows. See Figure 401.

(a) Remove the protection covers.

(b) Install a new gasket to the front flange of the cooling air duct. Attach the gasket to the duct flange with Paraffin Wax P05-059.

(c) Install a new metering orifice seal plate, convex side outward, to the HPT pad located approximately at the 1 o'clock position. Attach the plate with Paraffin Wax P05-059.

(d) (Pre SB PW4ENG 75−114) Install the cooling air duct to the HPT pad and to the valve flange. Attach the duct with the bolts, threads lubricated with Engine Oil P03−001, with the larger bolts at the rear flange. Tighten the bolts by hand.

(e) (Post SB PW4ENG 75−114) Install the cooling air duct to the HPT pad and to the valve flange. Attach the duct with the bolts, threads lubricated with Engine Oil P03−001, with the larger bolts at the rear flange and the silver plated bolts at the forward flange. Tighten the bolts by hand.

(f) Install a clamp over the cooling air duct at the support on the diffuser case at approximately the 2 o'clock position. Attach the clamp to the support with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(g) Torque the bolts at the front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m). Continue to torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m) until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(h) Torque the bolts at the rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m). Continue to torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m) until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(2) Install the (lower right) turbine vane cooling air duct (AP02) as follows. See Figure 401.

(a) Remove protective closures.

(b) Install a new gasket to the flange of the turbine vane and blade cooling air valve and hold in position with Paraffin Wax P05−059.

(c) Install a new gasket to the HPT pad at approximately the 4 o'clock position and hold in position with Paraffin Wax P05−059.

(d) Install the cooling air duct to the HPT boss and to the rear of the cooling air valve and attach with bolts, threads lubricated with Engine Oil P03−001, larger bolts at rear flange. Tighten the bolts by hand.

(e) Install the clamp over the cooling air duct and to the bracket on Flange M. Attach with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque the bolts at the front flange to 85 − 95 lb−in. (9.604 − 10.735 N.m). Continue to torque the bolts until the torque is kept. Torque the bolts at the rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m). Continue to torque the bolts until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at the rear flange of the duct.

(3) Install turbine vane cooling air duct (upper left) (AP04) as follows. See Figure 402.

(a) Remove protective closures.

(b) Secure a new gasket in place on flange of turbine cooling air valve with Paraffin Wax P05−059.

(c) Install a new gasket in place on the HPT pad with Paraffin Wax P05−059 at approximately the 9 o'clock position.

(d) Position cooling air duct to HPT boss and to rear of cooling air valve and secure with bolts, threads lubricated with Engine Oil P03−001, larger bolts at rear flange handtight only.

(e) Position clamp to cooling air duct at bracket on diffuser case and secure with bolts and nuts lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque bolts at forward flange to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to same limit without loosening until torque is maintained. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at the rear flange of the duct.

(4) Install turbine vane cooling air duct (lower left) (AP03) as follows. See Figure 402.

(a) Remove protective closures.

(b) Secure a new gasket in place on HPC case boss with Paraffin Wax P05−059 at approximately 9 o'clock position.

(c) Install a metering orifice seal plate in place to the pad at approximately the 7 o'clock position on the HPT case with Paraffin Wax P05−059.

(d) Position cooling air duct to above pads and secure rear of duct with bolts, threads lubricated with Engine Oil P03−001, larger bolts at rear flange handtight only.

(e) Align boltholes of bracket (attached to No. 4 bearing oil pressure tube) with boltholes in front flange of duct. Secure front flange and bracket with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(f) Position clamp over duct at bracket on diffuser case boss and secure to bracket with bolts, threads lubricated with Engine Oil P03−001, an nuts. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts. Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or

Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(h) Torque the clamp bolt that attaches the No. 4 bearing oil pressure tube to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Install a bolt, threads lubricated with Engine Oil P03−001, and a nut to the clamp that attaches the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air tube. Adjust the spray shield on the inboard side of the manifold and torque the bolt clamp to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(j) For engines equipped, install gasket to borescope plug groove. Install plug to rear elbow and engage end of plug into inner hole to seat. Install three bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

Task 72-00-52-420-002:

1. Install The High Pressure Turbine - Vertical

NOTE: See Figure 401 for Part/Assembly Installation Procedure Sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-52-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

NOTE: The flameless torch specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25000	Wrench, Hydraulic
PWA 25672	Control, Heater (Optional To PWA 29754)
PWA 28657	Sling
PWA 28668	Pump, Hydraulic (Electric) (Use With Hydraulic Wrench)
PWA 28669	Cart, Storage (Optional) (Use With Hydraulic Wrench)
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical*
PWA 29754	Control, Heater
PWA 45419	Air Torque Multiplier* (Optional To PWA 80651) (Use With Mechanical Wrench)
PWA 75028	Gage

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-08

Special Tools:

(CONTINUED)

	PWA 76154	Adapter (2 Required)
	PWA 76156	Adapter (2 Required)
	PWA 80651	Multiplier, Pneumatic* (Use With Mechanical Wrench)
	PWA 85107	Fixture
	PWA 85113	Wrench
	PWA 85114	Wrench, Torque (Use With Hydraulic Wrench)
	PWA 85115	Adapter, Wrench (Use With Hydraulic Wrench)
	PWA 85116	Wrench, Torque (Use With Mechanical Wrench)
	PWA 85117	Adapter, Wrench (Use With Mechanical Wrench)
	PWA 102392	Rod Assembly
	PWA 87870	Heater
	PWA 88643	Sling (Optional To PWA 88673)
	PWA 88673	Sling
R R	PWA 88703	Rod Assembly (HPT Installation) (Post SB PW4ENG 72-562) (Replaced By PWA 104153)
R	PWA 102392	Rod Assembly (HPT Installation)
R R	PWA 102462	Rod Assembly (HPT Installation) (Pre SB PW4ENG 72-562) (Replaced By PWA 104281)
R R	PWA 104153	Rod Assembly (HPT Installation) (Post SB PW4ENG 72-562)
R R	PWA 104281	Rod Assembly (HPT Installation) (Pre SB PW4ENG 72-562)

*See Table 401 for the mechanical wrench tool options. The table shows the correct combinations of tools to install the No. 3 bearing retaining nut.

NOTE: The high pressure turbine is stored on PWA 87022 Stand or optional PWA 85108 Stand.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-003	Compound, Antigalling (PWA 586)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72−00−52/1/10

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 350°F (176.7°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quick Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS. DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

CAUTION: FIRST STAGE HPT BLADES WITH THERMAL BARRIER COATING (TBC) (POST SB PW4ENG 72−466) CAN ONLY BE USED IN ENGINES WITH A TURBINE NOZZLE THAT INCORPORATES A STAGE 1 HPT (BLADE) COOLING DUCT ASSEMBLY (POST SB PW4ENG 72−466) THAT WILL SUPPLY INCREASED AIRFLOW OR DAMAGE TO THE BLADES CAN OCCUR.

CAUTION: BEFORE YOU INSTALL AND SEAT THE HPT MODULE, MAKE SURE THE NO. 3 BEARING, SPACERS AND SEALS ARE FULLY SEATED AGAINST THE HPC SHAFT SHOULDER AND EACH OTHER.

(1) If necessary, remove nuts and screws that attach PWA 86058 Retainer to the rear flange of the turbine case. Remove the retainer.

R
R

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(2) Install PWA 85107 Fixture to high pressure turbine. See Figure 402.

(a) If installed, remove hydraulic cylinder and plate from pilot ring. Remove center retainer and four jaws.

(b) For engines (Pre SB PW4ENG 72-176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(c) For engines (Post SB PW4ENG 72-176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72-176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(d) Loosen eight hand knobs (402/7) at center hub (402/9) of fixture and move piloting ring rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(e) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Trunnion to front end down position.

(f) With dowel at 6 o'clock position, align boltholes and lower fixture onto rear flange of turbine case. Install 26 screws (402/6), with spacers (402/5) under screw heads, through case flange and into two outer flanges of fixture.

(g) Loosen eight hand knobs (402/7) at center hub and carefully lower pilot ring (402/8) until it contacts turbine intermediate hub. Tighten eight hand knobs to secure pilot ring.

(h) Position four jaws (402/3) into center of fixture, locating lip of jaw in ID cutout of turbine hub. Lightly tighten screws (402/4) to secure jaws.

(i) Install retainer (402/10) into center of fixture to retain jaws. Tighten screws (402/4) to secure jaws.

(j) Align bolt holes and position plate (402/2), with plug (402/1), onto piloting ring and secure with 12 screws (402/11).

(3) Make a visual examination of the HPC rear shaft and rear HPC drum to identify which features these parts have. You must do this examination so that you can select the correct installation tools for each type of HPC rear shaft and drum. Examine the inside of the shaft with a light source and a mirror. There are three types of HPC shafts and HPC rear drums, see Figure 403 (Sheet 1) and Figure 403 (Sheet 2):

- HPC rear shaft integral with HPC rear drum (one piece)

- HPC rear shaft bolted to HPC rear drum (two pieces, without shaft bore)

- HPC rear shaft with inside bore that is bolted to HPC rear drum (two pieces)

(4) After you have identified the type of HPC rear shaft and HPC rear drum that you have, make a tool selection to match the type of HPC rear shaft and rear drum as follows:

CAUTION: YOU MUST DO THE EXAMINATION OF THE HPC REAR SHAFT AND REAR DRUM BEFORE YOU SELECT THE INSTALLATION TOOLS. IF YOU USE THE WRONG

TOOLS, MUCH DAMAGE TO THE HPC SHAFT CAN OCCUR.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(5) FOR THE HPC REAR SHAFT INTEGRAL WITH HPC REAR DRUM (ONE PIECE): Install the PWA 85107 Fixture (prior to Change Letter K) or the PWA 102392 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear hub. See Figure 404 (Sheet 1) and Figure 404 (Sheet 2).

(a) If necessary, adjust position of guide (404/2) to permit the clamp (404/1) at the end of the rod to turn to the horizontal position with the shaft (404/4). Tighten the jamnuts to lock the guide in position.

(b) Remove jamnut (404/6) on end of shaft (404/4) and remove clamp (404/5).

(c) Rotate clamp (404/1) to horizontal position. Install shaft (404/4) into HPC rear hub (404/8) until clamp is allowed to tilt and touch on the conical surface in the ID of the HPC rear hub.

(d) Check the position of pilot (404/3). It should be approximately 1.0 inch (25.4 mm) from the end of the HPC rear hub (404/8).

(e) If required, remove shaft (404/4) and clamp assembly. Adjust position of pilot as necessary. Tighten jamnut to secure pilot. Reinstall shaft in HPC rear hub per previous step.

(f) Position clamp, smaller OD end first, onto shaft and secure with jamnut (404/6) to lock shaft assembly in HPC rear hub.

(g) Install the coupler (404/7), a detail of PWA 85107 Fixture, onto the end of the shaft (404/4).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(6) FOR HPC REAR SHAFT BOLTED TO HPC REAR DRUM (TWO PIECES, WITHOUT SHAFT BORE, PRE SB PW4ENG 72−562): Install the PWA 85107 Fixture (prior to Change Letter K) or the PWA 102462 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear hub. See Figure 405 (Sheet 1) and Figure 405 (Sheet 2).

R NOTE: You can install the HPT with the optional PWA
R 104281 Rod Assembly.

(a) If necessary, adjust the position of the guide (405/2) to permit the shoe (405/1) at the end of the rod to turn to the horizontal position with the rod (405/5). Tighten the jamnuts to lock the guide (405/2) in position.

(b) Remove the jamnut (405/6) on the end of the rod (405/5) and remove the rod clamp (405/4).

(c) Turn the shoe (405/1) to the horizontal (parallel to rod) position with the push/pull control (405/6) and lock in this position. Install the rod assembly, shoe end first, into the HPC rear hub (405/9) as for as it will go.

(d) Unlock and turn the shoe (405/1) with the push/pull control (405/6) until the shoe (405/1) is in the vertical position (90° to rod). Pull the rod assembly rearward until the shoe (405/1) touches the conical surface in the ID of the HPC rear hub (405/9).

(e) The pilot (405/3) should be approximately 1.0 inch (25.4 mm) from the end of the HPC rear shaft (405/8).

(f) If necessary, remove rod (405/5) and shoe (405/1). Adjust the position of the pilot (405/3) as necessary. Tighten the jamnut to secure the pilot (405/3). Install the rod (405/5) and shoe (405/1) in the HPC rear hub again (405/9).

(g) Position rod clamp (405/4), smaller OD end first, onto the shaft. Tighten jamnut (405/6) to lock rod assembly in the HPC rear hub (405/9).

(h) Install the coupler (405/8), a detail of the PWA 85107 Fixture, onto the end of the shaft (405/9).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(7) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72-562): Install the PWA 88703 Rod Assembly together with the PWA 85107 Fixture (Change Letter K and subsequent), into the high pressure compressor rear drum, rear disk. The detail hydraulic cylinder, plug, and plate are removed from the rear end of the PWA 85107 Fixture. See Figure 406 (Sheet 1) and Figure 406 (Sheet 2).

R NOTE: See the following step to install the HPT with
R the optional PWA 104153 Rod Assembly.

(a) Attach the detail shoulder eyebolt and coupling of the PWA 85107 Fixture to the rear end of the detail shaft of the PWA 88703 Rod Assembly. Attach an overhead hoist to the eyebolt and lift the PWA 88703 Rod Assembly.

(b) Turn back the rear detail hex nut (406/6) of the shaft until the nut covers the rear red mark on the shaft.

(c) Pull the two detail push-pull controls (406/9) and turn the handles to lock the controls in the retracted position.

(d) Put the front end of the PWA 88703 Rod Assembly into the HPC rear shaft and push the rod assembly forward as far as it will go.

(e) Turn the handles of the push-pull controls (406/9) to unlock the controls and open the two detail feet (406/1).

(f) Carefully pull the rod assembly rearward to engage the detail feet (406/1) against the front face of the HPC rear drum rear flange.

(g) Turn the rear detail hex nut (406/6) on the shaft forward until it touches the detail shaft clamp (406/5). Make sure the forward red mark is visible. If it is not, turn the hex nut (406/6) rearward and shake the rod assembly to get it to properly engage against the HPC rear drum rear flange. Turn the rear detail hex nut (406/6) on the shaft forward until it touches the detail shaft clamp (406/5). Make sure the forward red mark is visible.

(h) Install the coupler (406/7), a detail of the PWA 85107 Fixture, onto the end of the shaft.

R CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

R (8) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72-562): Install the PWA 104153 Rod Assembly into the high pressure compressor rear drum, rear disk. See Figure 406 (Sheet 3).

R (a) Attach the detail lifting tool (406/5) to the rear end of the detail shaft (406/2) of the PWA 104153 Rod Assembly. Attach an overhead hoist to the lifting tool and lift the shaft.

R (b) Turn back the rear detail locking nut (406/4) on the shaft (406/2) until the nut covers the rear red mark on the shaft.

R (c) Insert the dowel pin (T-handle) (406/6) into the guide rod (406/8).

R (d) Pull on the (T-handle) (406/6) and turn it 1/4 turn to hold the feet (406/1)in the retracted (closed) position.

R (e) Use the hoist to lower the front end of the Rod Assembly into the HPC rear shaft as far as it will go.

R (f) Look into the shaft opening to make sure that the feet (406/1) have the necessary clearance to open.

R (g) Turn the handle 1/4 turn and push the guide rod (406/8) forward to open the feet (406/1).

R (h) Use the hoist to carefully lift the Rod Assembly until the feet (406/1) touch the front face of the HPC rear drum.

R (i) Engage the shaft clamp (406/3) into the turbine shaft ID and lock the shaft clamp in position with the locking nut (406/4).

R (j) Make sure that the nut overlaps or gets below the red mark on the shaft. If not, loosen the locking nut (406/4) and carefully shake the Rod Assembly lightly to re−adjust the feet (406/1).

R (k) Remove the dowel pin (T−handle) (406/6) from the guide rod (406/8).

R (l) Remove the lifting tool (406/5).

R (m) Install the coupler (406/7) onto the end of the shaft (406/2).

R (9) Lubricate the ID snap diameters and splines of the HPC shaft with Antigalling Compound P06−003. See Figure 407.

R (10) Position PWA 87870 Heater onto a standard workbench.

R (11) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Lift high pressure turbine from stand and position it on the heater.

CAUTION: THE THERMOCOUPLE MUST TOUCH THE END OF THE TURBINE SHAFT OR YOU CAN HEAT THE PART TOO MUCH.

R (12) Connect PWA 29754 Heater Control to the heater. Heat the turbine hub to 270° − 350°F (132.° − 177.°C) maximum. After the hub is heated, remove the heater and controller.

NOTE: After you heat the HPT hubs, do steps (12) through (19) in rapid succession.

R (13) Use the hoist to lift turbine from the heater. Trunnion the turbine to the horizontal position, and put it to the rear of the engine.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSTALLATION−08

R (14) Install the gasket onto the front outer flange of the turbine case. See Figure 408.

R (15) If applicable, locate the optional PWA 85112 Retaining Fixture in ID of turbine between front and rear turbine hubs. Rotate knurled nut to retract fixture. Remove fixture from hubs.

R (16) Move turbine into position, aligning turbine front hub splines with HPC (rear hub) splines. Move assembly forward to engage splines. Continue moving assembly forward until stopped at tight fit.

NOTE: Since high pressure turbine rotor cannot be rotated, it may be necessary to rotate high pressure compressor rotor to align splines.

R (17) Put hydraulic cylinder (409/2) over coupler (409/5) and against plug (409/6) in the center of fixture (409/1). Attach the hydraulic cylinder with spacer (409/3) and flanged nut (409/4). See Figure 409.

R (18) Connect PWA 29389 Pump or PWA 3755 Pump, with PWA 75028 Gage to hydraulic cylinder.

R (19) Install ten workbolts and nuts evenly spaced through turbine front case and diffuser case, Flange M, from rear to front.

CAUTION: YOU MUST LOOSEN THE EIGHT HAND KNOBS (409/6), THAT HOLD THE PILOTING RING (402/8), SO THAT THE RING MOVES FREELY AGAINST THE TURBINE INTERMEDIATE HUB BEFORE YOU APPLY A LOAD OF 38,500 − 41,500 LBF. (171,256.5 − 184,601.2 N) FOR THE SECOND TIME OR DAMAGE TO THE ENGINE CAN OCCUR.

R (20) (Reference 976) Seat turbine by tightening workbolts while actuating hydraulic pump to apply load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N). Release hydraulic pressure. Loosen eight hand knobs (409/6). Apply load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 5,332 − 5,747 psig (36,762.8 − 39,624.2 kPa) will apply a load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 2,905 − 3,132 psig (20,029.3 − 21,594.4 kPa) will apply a load of 38,500 − 41,500 lbf. (171,256.5 − 184,601.2 N).

R (21) Release the hydraulic load. Remove nut (410/7) and spacer (410/6) and remove hydraulic cylinder (410/5). Remove screws (410/4) and plate (410/3). Remove retainer (410/2) and four jaws (410/1) from the ID of fixture (410/11). See Figure 410.

R (22) Lubricate the axial faces of the turbine shaft spacer with Antigalling Compound P06−003. See Figure 411.

R (23) Install turbine shaft spacer (410/9) onto HPC rear hub.

R (24) Lubricate the threads and splines of the No. 3 bearing retaining nut with Antigalling Compound P06−003. See Figure 411.

CAUTION: THE NO. 3 BEARING NUT MUST BE SILVER PLATED PRIOR TO EACH HIGH PRESSURE TURBINE INSTALLATION OR DAMAGE TO THE MATING PARTS CAN OCCUR. THE NUT CAN BE REMOVED AND RETORQUED FOR EACH HIGH PRESSURE TURBINE INSTALLATION A MAXIMUM OF THREE TIMES BEFORE REQUIRING REPLATING.

CAUTION: IF THE NUT IS REMOVED AFTER AN ENGINE RUN, IT MUST BE REPLATED.

R (25) Thread the No. 3 bearing retaining nut (410/8) to the HPC rear hub. Hand tighten the nut. Use PWA 85113 Hand Wrench. Leave the hand wrench in position. Install the plate (410/3) and secure with 12 screws (410/4). Install the hydraulic cylinder (410/5) over the coupler (410/10) and seat against the plug in the center of plate (410/3). Attach the hydraulic cylinder with spacer (410/6) and nut (410/7).

NOTE: Do not install retainer or jaws.

CAUTION: MAKE SURE THE HYDRAULIC PRESSURE IS KEPT WHILE YOU TIGHTEN THE NUT OR THE NUT WILL NOT SEAT CORRECTLY AND DAMAGE TO THE ENGINE CAN OCCUR.

R (26) (Reference 976) Actuate the hydraulic pump and apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0

N). Use the PWA 85113 Hand Wrench to tighten the nut until the nut is seated on the hub.

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 8,310 − 8,725 psig (57,295.4 − 60,156.8 kPa) will apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 4,528 − 4,755 psig (31,219.5 − 32,784.6 kPa) will apply a load of 60,000 − 63,000 lbf. (266,893.3 − 280,238.0 N).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

R (27) Release load and remove rod assembly.

(a) Remove the hydraulic pump, nut (410/7), spacer (410/6) and hydraulic cylinder (410/5). Remove screws (410/4) and plate (410/3).

(b) Remove bolts that attach PWA 85107 Fixture to the turbine case rear flange. Remove the fixture, sling, and hoist.

(c) FOR THE HPC REAR SHAFT INTEGRAL WITH HPC REAR DRUM (ONE PIECE): Remove the PWA 102392 Rod Assembly as follows: See Figure 404 (Sheet 1) and (Sheet 2).

1 Carefully remove the coupler (404/7) and clamp (404/5) from the shaft (404/4).

(d) FOR HPC REAR SHAFT BOLTED TO HPC REAR DRUM (TWO PIECES, WITHOUT SHAFT BORE, PRE SB PW4ENG 72−562): Remove the PWA 102462 Rod Assembly as follows: See Figure 405 (Sheet 1) and (Sheet 2).

1 Carefully remove coupler (405/8) and rod clamp (405/4) from rod (405/5).

2 Use push/pull control (405/6) to turn shoe (405/1) to the horizontal position.

3 Carefully remove rod assembly from the HPC rear shaft (405/9).

(e) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG 72-562): Remove the PWA 88703 Rod Assembly as follows: See Figure 406.

R NOTE: See the following step to remove the the
R optional PWA 104153 Rod Assembly.

1 Carefully remove coupler (406/7).

2 Turn detail rear hex nut (406/6) on the shaft rearward until it covers the rear red mark on the shaft.

3 Carefully push the rod assembly forward as far as it will go.

4 Turn the two detail handles of the push/pull controls (406/9) to unlock the two detail feet (406/1) and pull the control handles rearward to disengage the feet.

5 Turn the push/pull control handles (406/9) to lock the feet (406/1) in the retracted position.

6 Carefully pull the PWA 88703 Rod Assembly rearward until the fixture is removed from the HPC rear shaft (406/8).

R (f) FOR HPC REAR SHAFT WITH INSIDE BORE THAT IS BOLTED
R TO HPC REAR DRUM (TWO PIECES, POST SB PW4ENG
R 72-562): Remove the PWA 104153 Rod Assembly as
R follows: See Figure 406 (Sheet 3).

R 1 Carefully remove the coupler (406/7) from the
R shaft (406/2).

R 2 Install the lifting tool (406/5) on the shaft
R (406/2).

R 3 Attach a hoist to the lifting tool (406/5).

R 4 Turn the detail locking nut (406/4) on the
R shaft (406/2) rearward until it covers the rear
R red mark on the shaft.

R 5 Insert the dowel pin (T-handle) (406/6) into
R the guide rod (406/8).

R CAUTION: LOWER THE ASSEMBLY ONLY ENOUGH TO
R CLOSE THE FEET (406/1) TO AVOID
R DAMAGE TO THE 15TH STAGE ROTOR DISK
R BORE.

R 6 Use the hoist to carefully lower the assembly
R into the HPC rear shaft to provide the
R necessary clearance to close the feet (406/1).

R a Turn the detail locking nut (406/4) rearward
R as necessary as you lower the assembly.

R b Look into the HPC rear shaft opening to
R make sure that the feet (406/1) have the
R necessary clearance to close.

R c If necessary, repeat the above step to
R provide clearance to close the feet (406/1).

R 7 With the necessary clearance to close the feet
R (406/1), use the T−handle to pull the guide
R rod (406/8) rearward until you can turn the
R T−handle 1/4 turn.

R NOTE: Turning the T−handle (406/6) 1/4 turn
R will hold the feet (406/1) in the
R retracted (closed) position.

R 8 Use the hoist to carefully lift the Rod
R Assembly from the HPC rear shaft.

R 9 Put the Rod Assembly in the storage container.

R 10 Remove the hoist.

R (28) For operators that use the mechanical wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 85116 Wrench into ID of No. 3 bearing retaining nut (412/4) engaging splines of wrench with splines of nut. See Figure 412.

(b) Install PWA 85117 Adapter to turbine intermediate hub (412/5) See Figure 412.

1 Loosen hex nuts (412/1) on eight clamps (412/2). Slide clamps in slots in opposite direction that arrow is pointing and secure clamps with hex nuts.

2 Using hoist and two PWA 76154 Adapters, connect PWA 28657 Sling, PWA 88643 Sling, or PWA 88673 Sling to trunnion spools on adapter.

3 Using hoist, position adapter over rear of PWA 85116 Wrench.

4 Insert clamp feet through slots (412/6) between lugs of hub.

5 Align teeth of adapter with slots between lugs of turbine intermediate hub. Loosen hex nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and insert pins (412/3) into holes in base of adapter. Tighten hex nuts to secure clamps.

NOTE: Plate in stud detail of clamp points to direction that clamp feet are facing.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85116 Wrench. Align anti−torque pins in wrench with bushings (412/1) in PWA 85117 Adapter and seat wrench on adapter. See Table 401 for mechanical wrench options. See Figure 413.

NOTE: Wrenches may be actuated using air torque multipliers to speed up removal of nut. See Table 401.

PWA Mechanical Wrench	PWA Torque Multiplier
PWA 29614	PWA 45419 or PWA 80651

Mechanical Wrench Options
Table 401

R (29) For operators that use the hydraulic wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 85114 Wrench into ID of No. 3 bearing retaining nut (414/3) engaging splines of wrench with splines of nut. See Figure 414.

(b) Install PWA 85115 Adapter to turbine intermediate hub (414/4).

1 Loosen wing nuts securing eight clamps (414/1). Slide clamps in slots in opposite direction of arrows on base of fixture and secure clamps with wing nuts.

2 Install eyebolt into threaded hole at top of adapter and connect hoist to eyebolt.

3 Using hoist, position adapter over PWA 85114 Wrench and onto rear of HPT.

4 Insert clamp feet through slots (414/5) between lugs of hub.

5 Align 16 teeth of adapter with slots between lugs of turbine intermediate hub. Loosen wing nuts and slide clamps in direction of arrows on base of fixture. Rotate clamps as required to position feet under lugs on hub and secure with wing nuts.

NOTE: Dowel pin (414/2) in stud detail of clamp points in direction that clamp feet are facing.

(c) Use a hoist and applicable sling to lift the PWA 25000 Hydraulic Wrench. Find the correct direction to turn the drive spline of the wrench. Refer to the PWA 29178 Instruction Decal on the hydraulic wrench to get the position of the shifting mechanism to cause the drive spline to turn in the tighten direction. See Figure 413.

NOTE: PWA 28669 Cart can be used to store and transport PWA 25000 Wrench.

(d) Connect PWA 28668 Pump or PWA 29510 Pump to the hydraulic wrench. Operate the wrench to make sure that the wrench turns in the tighten direction.

(e) Align splines and position PWA 25000 Wrench onto PWA 85114 Wrench. Move wrench forward and engage keys of PWA 85115 Adapter with keyways in PWA 25000 Wrench. See Figure 414.

(f) Connect PWA 28668 Pump or PWA 29510 Pump to wrench.

(g) Use the selector to operate the wrench (in the following step). As the drive spline turns, look at the travel indicator. When the travel indicator reaches its maximum travel, use the selector control valve to let the wrench ratchet return. Repeat this procedure as necessary (in the following step) until the nut is tightened. See Figure 415.

R (30) (Reference 976) Actuate wrench to torque No. 3 bearing retaining nut.

CAUTION: THE NUT MUST NOT MOVE WITH THIS TORQUE RANGE. IF THE NUT MOVES, THE STACK NOT SEATED AND THIS PROCEDURE FROM STEP (16) ONWARD MUST BE DONE AGAIN. IF THE NUT DOES NOT MOVE, CONTINUE WITH THE ANGLE OF TURN. IF THE NUT MOVES AFTER THE SECOND ATTEMPT OF STEPS (16) AND ON, PROCEED TO THE ANGLE OF TURN.

(a) Torque the nut to 6000 − 10000 lb−in. (677.909 − 1129.848 N.m) to make sure the stack is tight.

(b) Set angle of turn scale to 0 and apply 90 − 94 degrees angle of turn.

R (31) After you do the angle of turn, measure the final torque necessary to move the nut in the forward direction. This can be done with a suitable hand torque wrench with the appropriate multiplier on the mechanical wrench. The minimum torque necessary to make sure of the correct loading is 75000 lb−in. (8473.860 N.m). If the final torque is less, continue the angle of turn up to an additional 20 degrees. Use only the additional angle of turn necessary to get the 75000 lb−in. (8473.860 N.m) final torque. If more than the additional 20 degree angle of turn is necessary to get the 75000 lb−in. (8473.860 N.m) final torque then you must do the procedure again from step (16) onward.

R (32) Remove wrenches from turbine hub.

R (33) Install No. 3 bearing retaining nut lock. See Figure 416.

(a) Install one retaining ring lock (416/2) into groove in ID spline of No. 3 bearing retaining nut (416/3).

(b) Align lugs on front of No. 3 bearing nut lock (416/1) with slots in HPC rear hub while mating splines of nut lock with No. 3 bearing retaining nut.

(c) Install second retaining ring lock (416/2) into groove in ID spline of retaining nut.

R (34) Remove all the unwanted antigalling compound from the nut and the hub.

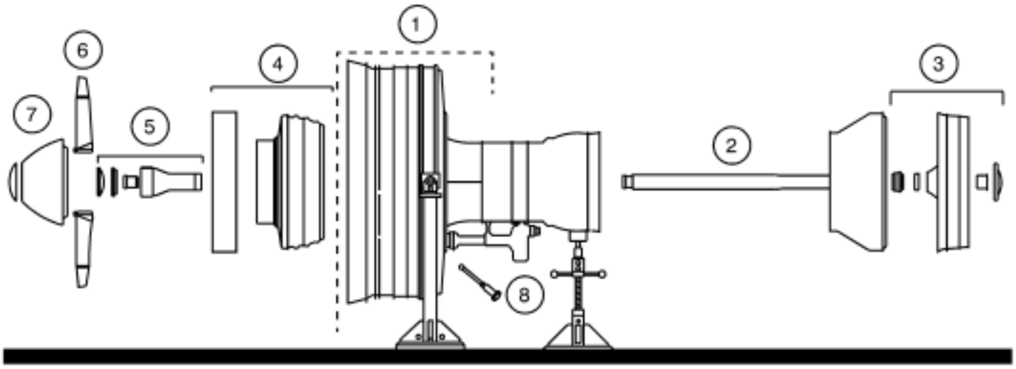
R (35) Install Flange M hardware as follows. Refer to 72−00−52, Installation−20 (Task 72−00−52−420−020).

E. Postrequisites

(1) Install The External Plumbing. Refer to 72−00−52, Installation−03 (Task 72−00−52−420−003).

(2) Install The Low Pressure Turbine. Refer to 72−00−53, Installation−01 (Task 72−00−53−420−001).

(3) Test the engine per the Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).



1. TRUNNION FAN CASE THROUGH HIGH PRESSURE TURBINE (HPT) TO HORIZONTAL.
2. INSTALL LOW PRESSURE TURBINE (LPT).
3. INSTALL TURBINE EXHAUST CASE.
4. INSTALL LOW PRESSURE COMPRESSOR (LPC).
5. INSTALL LPC/LPT COUPLING.
6. INSTALL STAGE 1 LPC BLADE ASSEMBLIES.
7. INSTALL COMPRESSOR INLET CONE.
8. INSTALL ELECTRONIC ENGINE CONTROL (EEC) SPEED TRANSDUCER (N1).

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-09

Task 72-00-52-420-002-002:

1. Install The High Pressure Turbine - Vertical (Hydraulic Wrench) - Deleted

   A. Procedure

      (1) This procedure is relocated to 72-00-52, Installation-08 (Task 72-00-52-420-002).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSTALLATION-20

Task 72-00-52-420-020:

1. Install The Flange M Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

B. Procedure

(1) Install Flange M hardware as follows: See Figure 401.

(a) Secure Flange M using bolts, lubricated with Engine Oil P03-001, nuts and brackets.

NOTE: Workbolts should be progressively removed from case flanges as engine bolts and nuts are installed.

NOTE: Index pin is located between holes 64 and 65.

(2) (Reference 978) Torque Flange M bolts. See Figure 401.

(a) Nuts must be tightened simultaneously in sets of two groups. Sets consist of groups numbered (1,2), (3,4), (5,6), (7,8), (9,10), (11,12), (13,14) and (15,16) See torque sequence specified in referenced figure.

NOTE: Fourteen of the 16 groups consist of eight bolts each. The remaining two groups consist of nine bolts each. See referenced figure.

(b) Tighten all sets of bolt groups described in previous step to initial torque of 75 - 100 lb-in. (8.474 - 11.298 N.m).

(c) Tighten all sets of bolt groups described in previous step to final torque of 180 - 200 lb-in. (20.337 - 22.597 N.m).

(d) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the double hex bolts at bolthole Locations 11 through 14, 39 through 42, 76 through 79, and 98 through 101.

(e) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the hex nuts at bolthole Locations 23 and 24, 28 and 29, 49 through 52, 97, and 112 through 115.

(f) Install two bolts, threads lubricated with Engine Oil P03−001, that attach the two brackets together at approximately the 4:30 o'clock position. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Leave protectors on 2nd stage turbine airseal land and 2nd stage blade trailing edges until low pressure turbine is installed.

(3) Remove any tags or markings on the brackets or flange.

(4) Examine the assembly for foreign objects, damage, and correct assembly.

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−01

Task 72−00−52−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−01

Task 72−00−52−990−002:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

Task 72-00-52-200-002:

1. Visually Inspect High Pressure Turbine

A. Equipment And Materials Required − None

B. General Inspection Requirements

(1) Parts which are within the sealing surface rub limits can continue in service without repair. These limits are evaluated from the standpoint of structural integrity, gross performance deficiencies and dimensional requirements for assembly. Excessive discontinuities in rubstrips will cause a decrease in efficiency and performance, and therefore, replacement of the sealing surfaces is suggested if maximum performance levels are desired.

(2) Visually inspect the high pressure turbine for obvious surface defects and/or deformations which will preclude proper functioning of any of the parts. If defects are noted on any of the parts see the individual part section for damage limits.

C. Procedure

Subtask 72-00-52-220-051:

R (1) Visually examine the Stage 1 and Stage 2 HPT duct
R segments ceramic material. See Figure 801 and Table
R 801.

(a) Definitions of inspection terms.

1 Chipped Areas: Ceramic removal areas caused by mechanical means.

2 Cracks: Narrow surface openings where ceramic material has separated.

3 Spalled Areas: Loss of ceramic material down to or into the ceramic/metallic layer caused by engine operating temperatures.

4 Erosion: Loss of the top porous layer of ceramic caused by the impingement of hot gaspath air.

Subtask 72−00−52−220−052:

R (2) Use feeler stock to make an inspection of the Stage
R 1 HPT blade tip clearance. Do the inspection at
R eight blade locations in non−spalled regions of the
R duct segments. The blade tip clearance must be in the
R limits given in Table 802. See Figure 802.

R (3) Use feeler stock to make an inspection of the Stage
R 2 HPT blade tip clearance. Do the inspection at
R eight blade locations in non−spalled regions of the
R duct segments. The blade tip clearance must be in the
R limits given in Table 802A. See Figure 802.

(4) Calculate the average clearance of the 8 measurements. This is the Average Clearance (AC).

(5) Make an estimate of the total percent of each duct segment surface area that is spalled as follows:

  (a) Multiply the number of segments by the percentage of spalling.

  (b) Add the results of the previous step to get the total percent.

  (c) Divide the total percent by 21 to get the average percentage of spalling.

  EXAMPLE: Out of 21 duct segments, 5 are spalled. Two are spalled approximately 30 percent. Three are spalled approximately 50 percent.

    (1) Spalled Segments X percentage of spalling

      2 segments X 30 percent = 60 percent
      3 segments X 50 percent = 150 percent
      Total = 210 percent

    (2) 210 percent/21 segments = 10 percent
    Therefore 10 percent of the segment surface is spalled.

(6) Find the increase in clearance due to ceramic spalling. Refer to Figure 803. This is the Spall Clearance (SC).

(7) Add the Spall Clearance (SC) to the Average Clearance (AC) to find the Effective Clearance (EC).

R (8) Make sure that the Effective Clearance (EC) is in the limits given in Table 802 for the Stage 1 duct segments and Table 802A for the Stage 2 duct segments. If the Effective Clearance (EC) is not in the limits given, the duct segments and/or blades are not serviceable.

(9) Find the Total Effective Clearance Remaining (TECR) for the module as follows:

TECR = (MC1 − EC1) + (MC2 − EC2)

Where MC1 is the Reference Number 1740 maximum permitted radial clearance for Stage 1,
EC1 is the Effective Clearance for Stage 1,
MC2 is the Reference Number 1741 maximum permitted radial clearance for Stage 2,
EC2 is the Effective Clearance for Stage 2.

(10) Find the Exhaust Gas Temperature (EGT) and the Thrust Specific Fuel Consumption (TSFC) remaining on the module. Refer to Figure 804 and Figure 805.

(11) Find that if you use the module again, that it will perform as necessary.
- EGT Margin necessary for the engine
- TSFC necessary for the engine
- Overhaul interval necessary for the engine

R Subtask 72−00−52−220−053:

R (12) Visually examine the Stage 1 airsealing ring for rub track wear. Smooth wear to a maximum of 0.006 inch (0.152 mm) is permitted. See Figure 806.

R	Inspect	Serviceable Limits	Repairable Limits	Repair
	Ceramic Layer Spalling and Chipping	Any number of duct segments can have any amount of spalling in the ceramic layer.		
	Ceramic/Metallic Layer Spalling and Chipping	Only one segment can have one corner spall 50 percent axially and 0.900 inch (22.860 mm) circumferentially. Two segments with one corner spall each with as follows: One at 50 percent axially and 0.500 inch (12.700 mm) circumferentially. One at 25 percent axially and 0.250 inch (6.350 mm) circumferentially.		
	Blade Tip Rub/Erosion	Any amount if the blade tip clearance is within the limits.		
	Blade tip material transfer	Any amount		
	Ceramic Layer Cracks	Any number in the ceramic layer. Cracks can be any length and can intersect.		
	Ceramic/Metallic Layer Cracks	Any number in the ceramic/metallic layer in the region greater than 0.050 inch (1.270 mm) from the metal support. Cracks can be any length and can intersect. One crack up to 0.250 inch (6.350 mm) in length is permitted within 0.050 inch (1.270 mm) of the metal support.		

Duct Segment Ceramic Material Inspection

R ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSPECTION/CHECK-03

R Task 72-00-52-200-003:

R 1. Examine The Stage 1 And Stage 2 HPT Blade Assemblies For
R Internal Sulfidation Distress

R A. General

R CAUTION: DO NOT CLEAN THE INTERNAL CAVITIES OF
R THE ENGINE RUN BLADES BEFORE YOU DO THIS
R INSPECTION.

R (1) The purpose of this inspection is to examine the stage
R 1 and stage 2 HPT turbine blades with a permeability
R probe for internal sulfidation. The probe will only
R touch the outer side of the blade airfoil for this
R procedure. This procedure is to examine the blades in
R a bladed rotor or module level configuration.

R NOTE: It is only permitted to clean the external blade
R surfaces using aqueous cleaning by SPOP 209
R (Task 70-21-00-110-041) or dry abrasive grit
R blast by SPOP 218 (Task 70-21-00-120-004) before
R this inspection.

R CAUTION: DO NOT LET THE PERMANENT MAGNET OF THE PROBE
R BECOME DEMAGNETIZED BY OTHER PERMANENT
R MAGNETS OR STRONG ALTERNATING CURRENTS.

R CAUTION: REMOVE THE PROBE PROTECTIVE CAP ONLY WHEN
R MEASUREMENTS WILL BE TAKEN.

R (2) This inspection uses the comparison method to find the
R presence of internal sulfidation with the use of PN
R 1.067-101-12 reference standard. Permeability between
R 1.4 and 1.5 is acceptable with the use of this standard
R only. The use of any other reference standards is not
R acceptable.

R (3) Only remove the probe protective cap from the probe to
R calibrate and take the inspection measurements.

R (4) It is recommended that you read the description and
R operating instructions manual for the Magnetoscop 1.069
R before you do this inspection. This will give you a
R basic knowledge of the Magnetoscop operation with the
R permeability probe.

R (5) The Magnetoscop 1.069 is the latest model release from
R Foerster Instruments Inc. Foerster no longer supports
R production of the Magnetoscop 1.067 and 1.068 models.

R ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−03

R (6) The PN 1.005−1526 permeability probe is manufactured with the Magnetoscop 1.069 adapter for bladed rotors or module inspection. This probe has a 1X sensitivity which will find the level of permeability necessary for this inspection.

R (7) If you use the older permeability probes, PN 1.005−1522 (1X), 1.005−1526 (1X), or 1.005−1532 (10X), designed for use with the Magnetoscop 1.067 and 1.068 models, it is necessary to use a PN 9064001 probe adapter with the Magnetoscop 1.069.

R B. Equipment And Materials Necessary

R Standard Tools:

Name	Manufacturer
Magnetoscop (T) Meter Model 1.069 Permeability Probe PN 1.005−1526 (1X) Or PN 1.005−1522 (1X) Or PN 1.005−1532 (10X)	Institute Dr. Foerster GmbH & Co. KG Im Laisen 70 D−72766 Reutlingen, Germany Or Foerster Instrument Inc. RIDC Park West 140 Industry Drive, Pittsburg, PA 15275 USA
Reference Standard PN 1.067−101−12	
Adapter, Magnetoscop 1.067/1.068 Probe PN 9064001	

R NOTE: All tools can be ordered from one of the above manufacturers.

R Consumable Materials:

Item No.	Designation
P05−018	Pencil, Metal Marking

R C. Calibration Procedure

R ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSPECTION/CHECK-03

R (1) Find an area for the inspection which does not have material (permeable or magnetic) that can change the meter needle deflection. See Figure 801 thru Figure 806 for all the tooling and inspection areas.

R (2) Connect the permeability probe to the Magnetoscop field intensity meter.

R (3) Set the power of the unit to ON. Let it operate for 10 minutes to warm up.

R (4) The instrument will find the type of probe you use. If you use an older Magnetoscop 1.067/1.068 probe which needs a 1.069 PN 9064001 probe adapter, a menu will show a list of probes you can use.

R (a) Select the applicable probe from the list.

R 1 If you use a new probe designed for the 1.069 model, the probe will be find it automatically.

R (5) Press the DC/AC/PERM (MODE) button until the instrument displays that it is in the Permeability Comparison Mode.

R (6) Press the RANGE button on the instrument.

R (a) Set the range so that the Magnetoscop will display readings between 1.000 and 2.000 mu.

R (7) Press the MENU button and select the calibration from the main menu.

R (8) Select OFFSET ADJUST from the calibration menu.

R (a) The instrument will adjust the offset of the system automatically. This can take up to one minute to complete.

R (b) The calibration menu will permit you to make another selection after you complete the offset.

R (9) Select PERM PROBE ZERO ADJUST from the calibration menu.

R (a) Adjust the thumb-wheel adjustment or the screw adjustment on the probe until the display is as near to zero as you can get it.

R ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−03

R (b) Once you do this, exit the menu.

R (10) Select the PERMEABILITY CALIBRATION from the
R calibration menu.

R (a) Input the calibration value from the reference
R standard into the instrument display, but do not
R press the ENTER key.

R (11) Put the 1.067−101−12 Reference Standard in an area away
R from permeable materials or magnetic fields.

R (12) Put the probe element on the center of the standard
R while you hold it perpendicular to the surface. See
R Figure 803.

R (13) Press the ENTER key on the instrument.

R (a) The instrument will calibrate itself with the
R value input from the reference standard. When
R completed, the display will return to the
R calibration menu.

R (b) Exit from this menu and the main menu, and then
R the calibration is complete.

R NOTE: When you remove the Magnetoscop from the
R standard and hold it in the air, the
R reading on the Magnetoscop must be 1.000 ±
R 0.005. If this is not the reading, then
R calibrate the system again.

R D. Inspection Procedure

R NOTE: Check the calibration of the permeability probe at
R the start and end of each inspection sequence or
R whenever the inspection was interrupted.

R CAUTION: DO NOT CLEAN THE BLADES INTERNALLY BEFORE
R YOU DO THE PERMEABILITY INSPECTION. THE
R PERMEABILITY LIMITS WERE ESTABLISHED ON
R BLADES THAT WERE IN SERVICE RUN CONDITION
R BEFORE CLEANING. CLEANING, ESPECIALLY THE
R INTERNAL CAVITY, BEFORE INSPECTION, CAN
R REMOVE THE SULFIDATION PRODUCT AND DECREASE
R THE PERMEABILITY VALUE. THIS WILL CHANGE
R THE CALIBRATED RELATIONSHIP BETWEEN THE
R PERMEABILITY AND THE REMAINING WALL THICKNESS

AND RESULT IN BLADES WITH AN UNSATISFACTORY WALL THICKNESS BEING RETURNED TO SERVICE.

(1) Remove all the dirt or deposits from the external airfoil surfaces with a soft bristle brush. See Figure 804.

(2) Traverse the permeability probe tip in a perpendicular orientation, along the external surfaces that you will examine, while you watch the meter for permeability indications. See Figure 805 and Figure 806.

(a) Traverse along the airfoil surface at a constant speed of 0.25 inch (6.35 mm) to 0.50 inch (12.7 mm) per second.

(b) If permeability indications are found, find the area which has the maximum permeability.

(c) Record the maximum permeability at the corresponding location on the airfoil surface. Use on a Metal Marking Pencil P05-018 to mark the blade airfoil.

E. Blade Inspection Limits

(1) All Stage 1 HPT blades which show a permeability equal to or more than 1.080 on the airfoil in the inspection area must be removed from service.

(2) All Stage 2 HPT blades which show a permeability equal to or more than 1.060 on the airfoil in the inspection area must be removed from service.

F. Report Of Inspection Results

(1) Report the inspection results to the local Pratt & Whitney Representative. Give the information which follows:

- Engine Serial Number
- Operator:
- Stage 1 HPT Blade Part Number:
- Stage 2 HPT Blade Part Number:
- Total Part Time:
- Total Part Cycles:
- Inspection Method:
- Results For Rejected Stage 1 Or Stage 2 HPT Blades:

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−10

Task 72-00-52-210-010:

1. Visually Examine The High Pressure Turbine (HPT) Module Assembly − Engine General − High Pressure Turbine (HPT)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P05−421	Nylon Pads And Rolls Abrasive−Impregnated (PMC 4095)

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (AD's) must be complied with and these directives takes precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero. The use of the limits in this inspection will not give the performance restoration.

(2) These procedures give instructions for the visual inspection of the high pressure turbine (HPT) module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. Refer to Section 70−31−00 for the general visual inspection instructions in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the high pressure turbine (HPT) modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component.

(4) This inspection does not authorize use of the Cleaning Inspection and Repairs listed at the modular level. Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72−52−00 in the PW4000 Series CIR, PN 51A357. Components that you remove from the high pressure turbine (HPT) module, after the module removal from the engine, will need a Cleaning, Inspection and Repair Manual component level inspection/check.

(5) Unless given differently, not toleranced areas given in this section are to corners, points of tangency between the surfaces or at the points opposite to one of these locations. The areas shown will have a tolerance of plus 0.125 inch (3.175 mm) in all directions unless adjacent areas are given as areas where damage is not permitted.

(6) Definitions of inspection terms:

   (a) Chipped areas: Loss of the ceramic material that is caused by mechanical means.

   (b) Cracks: Narrow surfaces openings where the ceramic material has separated.

   (c) Spalled Areas: Loss of the ceramic material that is caused by the engine operating temperatures.

   (d) Erosion: Loss of the top porous layer of the ceramic material that is caused by wear from the hot gaspath air and/or particles.

C. Procedure

(1) For all the engine models other than 4158 engine model with more than more than 1000 cycles until the next scheduled shop visit, examine the stage 1 and stage 2 duct segments for damaged coat. See Figure 801 and Table 801.

(2) For the 4158 (Talon II burner) engine model only with more than 500 cycles until the next scheduled shop visit, examine the stage 1 and stage 2 duct segments for damaged coat. See Figure 801 and Table 801.

(3) For all the engine models other than 4158 engine model with 1000 cycles or less until the next scheduled shop visit, examine the stage 1 and stage 2 duct segments for damaged coating. See Figure 801 and Table 802.

(4) For the 4158 (Talon II burner) engine model only with 500 cycles or less until the next scheduled shop visit, examine the stage 1 and stage 2 duct segments for damaged coating. See Figure 801 and Table 802.

(5) Measure the stage 1 and stage 2 blade tip clearance. See Figure 802 and Table 803.

(6) Examine the stage 1 turbine front hub. See Figure 803 (Sheet 1), Figure 803 (Sheet 2) and Table 804.

(7) Examine the stage 1 blade. See Figure 804 (Sheet 1), Figure 804 (Sheet 2) and Table 805.

(8) Examine the stage 1 outer rotating airseal. See Figure 805 and Table 806.

NOTE: If the stage 1 outer rotating airseal exhibits light surface corrosion and pitting, it must be surface cleaned by SPOP 209 (Task 70−21−00−110−041) before this inspection. Refer to Section 70−21−00 in the Standard Practices Manual, PN 585005. If necessary, use Abrasive Impregnated Nylon Pad P05−421 or soft non−metallic brush to clean the inspection area and SPOP 209 can be followed again to remove all the loose debris.

(9) Examine the stage 1 inner rotating airseal. See Figure 806 and Table 807.

(10) Examine the stage 1 airsealing ring. See Figure 807 and Table 808.

(11) Examine the stage 2 turbine intermediate hub. See Figure 808 and Table 809.

NOTE: If the stage 2 turbine intermediate hub is removed, examine the stage 2 rotating airseal by Section 72−52−22, Inspection/Check−03 in the PW4000 Series CIR, PN 51A357.

(12) Examine the turbine case. See Figure 809 (Sheet 1), Figure 809 (Sheet 2) and Table 810.

(13) Examine the stage 2 vane ceramic coat. See Figure 810 (Sheet 1), Figure 810 (Sheet 2), Figure 810 (Sheet 3) and Table 811.

(14) Examine the stage 2 vane. See Figure 811 and Table 812.

(15) Examine the stage 2 blade. See Figure 812 (Sheet 1), Figure 812 (Sheet 2), Figure 812 (Sheet 3) and Table 813.

(16) Examine the stage 2 blade retaining plate. See Figure 813 and Table 814.

(17) Examine the stage 1 duct support assembly. See Figure 814 and Table 815.

(18) Examine the stage 2 duct support assembly. See Figure 815 and Table 816.

(19) Examine the stage 1 HPT duct band segments. See Figure 816 and Table 817.

(20) Examine the stage 2 vane platform feather seal. See Figure 817 and Table 818.

R (21) Do the permeability inspection for internal sulfidation
R distress on the stage 1 and stage 2 HPT blades. Refer
R to Inspection/Check−03 (Task 72−00−52−200−003).

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 and Stage 2 duct segments. See Figure 801			
NOTE: If you accept these servicable limits, it can result in exhaust gas temperature (EGT) margin loss and a decrease in the repairability of the duct segments at the next overhaul.			
Ceramic layer surface (crazing) cracks	All quantities of cracks are permitted in the ceramic layer	Ceramic coat can be repaired	See Note
Ceramic layer chipping and spalling	If damage is not in the blade rub area: All quantities to a maximum of 0.125 inch (3.175 mm) diameter or 0.012 sq-in (8. sq-mm) maximum to a depth of 0.060 inch (1.524 mm) maximum A maximum of two chipped areas for each segment to a maximum of 0.250 inch (6.350 mm) diameter or 0.050 sq-in (32. sq-mm) maximum to a depth of 0.060 inch (1.524 mm)	Ceramic coat can be repaired	See Note

Duct Segment Coat Inspection For Engines With More Than 1000 Cycles/500 Cycles (4158 Model Only) Until Next Shop Visit
Table 801

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	maximum One chipped area for each segment to a maximum of 0.500 inch (12.700 mm) in diameter or 0.200 sq-in (129. sq-mm) maximum to a depth of 0.060 inch (1.524 mm) maximum		
Ceramic/ metallic layer chipping and spalling	Not permitted	Ceramic material can be repaired	See Note
Ceramic layer erosion	All quantities if blade tip clearance is in limits given in Table 803	Ceramic material can be repaired	See Note
Blade tip material transfer	All quantities if blade tip clearance is in limits given in Table 803	Ceramic material can be repaired	See Note

NOTE: For stage 1 duct segment: Refer to Section 72-52-32, Repair-01 or Repair-06 in the PW4000 Series CIR, PN 51A357.

NOTE: For stage 2 duct segment: Refer to Section 72-52-35, Repair-01 or Repair-05 in the PW4000 Series CIR, PN 51A357.

Table 802 (Continued)

Reference Number	Maximum Radial Clearance Permitted

A. Measure the average tip clearance.

1. Use a feeler stock to do an inspection of the stage 1 HPT blade tip clearance. Do the inspection at eight equal distances apart non-spalled blade locations. Calculate the average clearance of the eight measurements. The blade tip clearance must be in the limits shown below.

2. Use a feeler stock to do an inspection of the stage 2 HPT blade tip clearance. Do the inspection at eight equal distances apart non-spalled blade locations. Calculate the average clearance of the eight measurements. The blade tip clearance must be in the limits shown below.

Stage 1 HPT blade tip clearance:	See Figure 802.
1740	0.112 inch (2.845 mm) (Pre-SB PW4ENG 72-712)
	0.112 inch (2.845 mm) (Post-SB PW4ENG 72-712)
1745	0.112 inch (2.845 mm) (Post-SB PW4ENG 72-735)
Stage 2 HPT blade tip clearance:	See Figure 802.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 turbine front hub. See Figure 803 (Sheet 1).			
1 (Other than cooling air holes)	Surface damage with no raised material to a maximum of 0.002 inch (0.051 mm) in depth. No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−05, Repair−04 in the PW4000 Series CIR, PN 51A357
2 For PN 50L501, 51L201, 51L201−021, 51L601 and 52L401 only: (Other than cooling air holes)	Surface damage with no raised material to a maximum of 0.002 inch (0.051 mm). No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−05, Repair−04 in the PW4000 Series CIR, PN 51A357
For PN 51L901 and 52L301 (Other than cooling air holes)	Surface damage with no raised material to a maximum of 0.002 inch (0.051 mm). No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.015 inch (0.381 mm) maximum depth	Refer to Section 72−52−05, Repair−04 in the PW4000 Series CIR, PN 51A357

Stage 1 Turbine Front Hub Inspection
Table 804

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3			
For PN 50L501, 51L201, 51L201-021, 51L601 and 52L401 only:	Surface damage with no raised material to a maximum of 0.002 inch (0.051 mm). Corrosion pitting is not permitted. No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.010 inch (0.254 mm) maximum depth. Scattered corrosion pitting to a maximum of 0.005 inch (0.127 mm) depth.	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357
For PN 51L901 and 52L301:	Surface damage with no raised material to a maximum of 0.002 inch (0.051 mm). Corrosion pitting is not permitted. No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.015 inch (0.381 mm) maximum depth. Scattered corrosion pitting to a maximum of 0.005 inch (0.127 mm) depth.	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357
4			
For PN 50L501, 51L201, 51L201-021, 51L601 and 52L401 only:	Surface damage with no raised material to a maximum of 0.001 inch (0.025 mm) in depth. No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.010 inch (0.254 mm) maximum depth	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357

Stage 1 Turbine Front Hub Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
For PN 51L901 and 52L301:	Surface damage with no raised material to a maximum of 0.001 inch (0.025 mm) in depth. No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.015 inch (0.381 mm) maximum depth, unless given differently	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357
5	Surface damage with no raised material is permitted to a maximum of 0.010 inch (0.254 mm). No damage is permitted in 0.050 inch (1.270 mm) of fillet radii.	0.015 inch (0.381 mm) maximum depth	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357
6 Splines	Scattered surface damage with no raised material is permitted on the inner diameter faces, sides and end of the spline teeth to a maximum of 0.006 inch (0.152 mm) depth	Raised material only. Do not blend below the initial spline surface.	Refer to Section 72-52-05, Repair-04 in the PW4000 Series CIR, PN 51A357 or splines can be polished by Section 70-45-00, SPOP 533 in the Standard Practices Manual, PN 585005
	No damage is permitted on		

Stage 1 Turbine Front Hub Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	the spline root fillet radii		
7	Surface damage with no raised material to a maximum of 0.010 inch (0.254 mm) depth on the lug end face.	Not repairable	Remove from service
8 Cooling air holes	No damage is permitted in 0.125 inch (3.175 mm) of holes	0.005 inch (0.127 mm) maximum depth	Refer to Section 72−52−05, Repair−04 in the PW4000 Series CIR, PN 51A357
	No mismatch is permitted inside the slots		
9 See Figure 803 (Sheet 2)	No damage is permitted in 0.050 inch (1.270 mm) of the fillet radii	Not repairable	Remove from service

NOTE: Examine all the areas that you can access where stage 1 rotor is installed or removed.

Stage 1 Turbine Front Hub Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 blade See Figure 804 (Sheet 1)			
Area A and Area B			
Surface cracks (Other than cooling hole cracks)	Not permitted		Remove from service
Trailing edge axial cracks	Not permitted	Two cracks to a maximum of 0.050 inch (1.270 mm) axial length	Refer to Section 72−52−07, Repair−01 in the PW4000 Series CIR, PN 51A357
Area B Cooling hole crack	Axial, radial or hole to hole cracks are permitted. No breakthrough or open areas. No intersecting cracks or imminent material liberation are permitted.		Remove from service
Area A Cooling hole crack	Not permitted		Remove from service

Stage 1 Blade Inspection
Table 805

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area A, Area B and Area C Burning, erosion and bare base material (Full blade and platform surface)	Not permitted	Not repairable	Remove from service
Areas A, Area B and Area C Spalled or eroded ceramic coat (Full blade and platform surface)	All quantities are permitted	See the repair	Refer to Section 72-52-07, Repair-05 in the PW4000 Series CIR, PN 51A357
Sulfidation on all the bare areas of blade shown by staining or trailing edge scale build-up	Not permitted		Remove from service
Area B Bent tip	Not permitted	Not repairable	Remove from service
Area A and Area B Leading edge, airfoil, tip and trailing edge cooling air holes/slot blockage	One maximum cooling hole/slot in each area can be blocked, If blockage is not sulfidation corrosion build-up.	All quantities can be cleaned if blockage is not sulfidation corrosion scale build-up	Refer to Section 72-52-00, Cleaning-04 in the PW4000 Series CIR, PN 51A357

Stage 1 Blade Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area B Tip rub or plasma coat missing	All quantities are permitted if not rubbed into the internal cavity	See the applicable repair	Refer to Section 72−52−07, Repair−06, Repair−07 and Repair−15 in the PW4000 Series CIR, PN 51A357
Area A and Area B Liberated blade parent material	Not permitted	Not repairable	Remove from service
Area A, Area B and Area C Airfoil bulging	Not permitted	Not repairable	Remove from service
Area D Nicks and dents See Figure 804 (Sheet 2)	Not permitted	Two blends to a maximum of 0.005 inch (0.127 mm) depth	Refer to Section 72−52−07, Repair−01 in the PW4000 Series CIR, PN 51A357
Area E Nicks and dents	All quantities of nicks or dents are permitted to a maximum of 0.005 inch (0.127 mm) depth		Remove from service

Stage 1 Blade Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area F Nicks and dents	One dent to a maximum of 0.010 inch (0.254 mm) depth and 0.100 inch (2.540 mm) maximum length. Dents must not block discharge port more than 50 percent. Nicks are not permitted.	Two blends to a maximum of 0.005 inch (0.127 mm) axial length from trailing edge	Refer to Section 72-52-07, Repair-01 in the PW4000 Series CIR, PN 51A357
Area G Nicks and dents	Not permitted	Not repairable	Remove from service
Area J and Area K Platform cracks (Top and bottom of platform surfaces are included) (See Figure 804 (Sheet 2))	All quantities of cracks are permitted in this area to a maximum of 0.120 inch (3.048 mm) in length. Cracks can go through the platform. Platform must not be curled or bent.		
Area L Platform cracks	All quantities of tight, hairline cracks to a maximum of 0.005 inch width and to a maximum of 0.150 inch in length are permitted.	0.010 inch (0.254 mm) in depth	Refer to Section 72-52-07, Repair-01 in the PW4000 Series CIR, PN 51A357

Stage 1 Blade Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
	Cracks must be clearly separated and must not intersect.		

Stage 1 Blade Inspection
Table 805 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 outer rotating airseal			
1 Surface Damage (See Figure 805)	Not Permitted	Locally blend surface damage to a maximum of 0.010 inch (0.254 mm) depth	Refer to Section 72−52−20, Repair−01 in the PW4000 Series CIR, PN 51A357
2 Surface damage	0.004 inch (0.102 mm) maximum depth other than for knife−edges	Locally blend surface damage to a maximum of 0.010 inch (0.254 mm) depth other than for knife−edges	Refer to Section 72−52−20, Repair−01 in the PW4000 Series CIR, PN 51A357
Knife−edge surface damage	Not permitted	See the repair	Refer to Section 72−52−20, Repair−02 in the PW4000 Series CIR, PN 51A357
3 General corrosion pitting. See Figure 805	0.005 inch (0.127 mm) maximum depth after cleaning. Refer to Section 70−21−00, SPOP 209 in the Standard Practices Manual, PN 585005. If necessary, use Abrasive	See the repair	Refer to Section 72−52−20, Repair−01 in the PW4000 Series CIR, PN 51A357

Stage 1 Outer Rotating Airseal Surface Damage Inspection
Table 806

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	Impregnated Nylon Pad P05-421 or soft non-metallic brush to clean the inspection area and SPOP 209 can be followed again to remove all the loose debris.		
4 Knife-edge area corrosion pitting	Not permitted	See the repair	Refer to Section 72-52-20, Repair-01 in the PW4000 Series CIR, PN 51A357
5 Knife-edge bending	0.020 inch (0.508 mm) maximum from the normal position	0.100 sq-in (65. sq-mm) is the maximum blend area for single knife-edge blend. 0.200 sq-in (129. sq-mm) is the maximum cumulative blend area for all single knife-edge. 0.300 sq-in (194. sq-mm) is the maximum cumulative blend area for three knife-edges	Refer to Section 72-52-20, Repair-02 in the PW4000 Series CIR, PN 51A357

Stage 1 Outer Rotating Airseal Surface Damage Inspection
Table 806 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
		Blends must have a length to depth ratio of 15 minimum and a blend radius to depth ratio of 30 minimum	

Stage 1 Outer Rotating Airseal Surface Damage Inspection
Table 806 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 inner rotating airseal (See Figure 806)			
Corrosion	Not serviceable	See the repair	Refer to Section 72−52−21, Repair−01 in the PW4000 Series CIR, PN 51A357

CAUTION: AIRSEALS, OTHER THAN KNIFE−EDGE AREAS, THAT HAVE CRACKS OR OTHER UNUSUAL CONDITIONS IDENTIFIED BY FLUORESCENT PENETRANT INSPECTION ARE NOT PERMITTED AND CANNOT BE REPAIRED.

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Cracks	Not serviceable	Not repairable	Remove from service
Surface damage:			
1	Not permitted	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−21, Repair−01 in the PW4000 Series CIR, PN 51A357
2	0.004 inch (0.102 mm) other than for knife−edge	0.010 inch (0.254 mm) other than for knife−edges	Refer to Section 72−52−21, Repair−01 in the PW4000 Series CIR, PN 51A357
3			
0.050 inch (1.270 mm) (reference)			

Stage 1 Inner Rotating Airseal Corrosion And Pitting Inspection
Table 807

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
4	No damages are permitted in 0.050 inch (1.270 mm) envelope around the full slot in all directions		
5			
Knife−edges for bending	0.020 inch (0.508 mm) maximum from the normal position	0.100 sq−in (65. sq−mm) maximum blend for each incident	Refer to Section 72−52−21, Repair−02 in the PW4000 Series CIR, PN 51A357
		0.200 sq−in (129. sq−mm) maximum all blends each knife−edge	
		0.300 sq−in (194. sq−mm) maximum all blends for the all three knife−edges	

Stage 1 Inner Rotating Airseal Corrosion And Pitting Inspection
Table 807 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 airsealing ring (See Figure 807)			
Corrosion	Not permitted on all surfaces	See the repair	Refer to Section 72-52-17, Repair-03 or Repair-05 in the PW4000 Series CIR, PN 51A357
1	Damage to a maximum of 0.004 inch (0.102 mm) in depth with no sharp edges	Damage between 0.004 - 0.010 inch (0.102 - 0.254 mm) in depth	Refer to Section 72-52-17, Repair-01 in the PW4000 Series CIR, PN 51A357
2	No damage is permitted in 0.050 inch (1.270 mm) of the radius	Not repairable	Remove from service
3 Rub track wear	Smooth wear to a maximum of 0.006 inch (0.152 mm) depth	See the repair	Refer to Section 72-52-17, Repair-03 or Repair-05 in the PW4000 Series CIR, PN 51A357
4 Surface damage	Damage to a maximum of 0.004 inch (0.102 mm) in depth with no sharp edges	Damage between 0.004 - 0.010 inch (0.102 - 0.254 mm) in depth	Refer to Section 72-52-17, Repair-01 in the PW4000 Series CIR, PN 51A357

Stage 1 Inner Airsealing Ring Inspection
Table 808

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
5	No damage is permitted without repair	0.030 inch (0.762 mm) maximum depth	Refer to Section 72−52−17, Repair−01 in the PW4000 Series CIR, PN 51A357

Stage 1 Inner Airsealing Ring Inspection
Table 808 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 turbine intermediate hub (See Figure 808)			
1	Surface damage to a maximum of 0.002 inch (0.051 mm) in depth unless given differently	0.010 inch (0.254 mm) maximum depth unless given differently	Refer to Section 72-52-06, Repair-08 in the PW4000 Series CIR, PN 51A357
2	Surface damage to a maximum of 0.002 inch (0.051 mm) in depth unless given differently	0.015 inch (0.381 mm) maximum depth unless given differently	Refer to Section 72-52-06, Repair-08 in the PW4000 Series CIR, PN 51A357
3 Cooling holes	No damage is permitted in 0.125 inch (3.175 mm) of holes	0.005 inch (0.127 mm) maximum depth	Refer to Section 72-52-06, Repair-08 in the PW4000 Series CIR, PN 51A357
4	Scattered surface damage to a maximum of 0.003 inch (0.076 mm)		
5	Scattered surface damage to a maximum of 0.005 inch (0.127 mm) depth if the combined damage is not more than 0.100 sq-in (65.		

Stage 2 Turbine Intermediate Hub Inspection
Table 809

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	sq−mm). Raised material is not permitted.		
6 Splines	Scattered surface damage is permitted on the inner diameter faces, sides and end of spline teeth to 0.006 inch (0.152 mm) maximum depth	Splines can be polished by Section 70−45−00, SPOP 533 in the Standard Practices Manual, PN 585005	Refer to Section 72−52−06, Repair−08 in the PW4000 Series CIR, PN 51A357
7 Hub inner diameter surface to spline front surface	Scattered surface damage to a maximum of 0.005 inch (0.127 mm) depth if there is no raised material	Blend to a maximum of 0.010 inch (0.254 mm) depth is permitted in the repair	Refer to Section 72−52−06, Repair−08 in the PW4000 Series CIR, PN 51A357
8 Lug	Surface damage to a maximum of 0.010 inch (0.254 mm) depth	See the repair	Refer to Section 72−52−06, Repair−08 in the PW4000 Series CIR, PN 51A357
9 Metering plugs for damaged loose and missing:			

Stage 2 Turbine Intermediate Hub Inspection
Table 809 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
For hub assembly PN 50L602−023, 50L602−024, 50L902−022 and 53L602:	Make sure that the four plugs are installed tight. Plugs snap in and can turn.	Replace the damaged, missing or loose plugs	Refer to Section 72−52−06, Repair−14 in the PW4000 Series CIR, PN 51A357
For hub assembly PN 50L602−021, 50L602−022, 50L602−025, 50L602−026, 50L902−021, 50L902−023, 52L002−021 and 52L802:	Make sure that the six plugs are installed tight. Plugs snap in and can turn.	Replace the damaged, missing or loose plugs	Refer to Section 72−52−06, Repair−14 in the PW4000 Series CIR, PN 51A357
For hub assembly PN 52L402:	Make sure that the eight plugs are installed tight. Plugs snap in and can turn.	Replace the damaged, missing or loose plugs	Refer to Section 72−52−06, Repair−14 in the PW4000 Series CIR, PN 51A357
For hub assembly PN 54L022:	Make sure that the two plugs are installed tight. Plugs snap in and can turn.	Replace the damaged, missing or loose plugs	Refer to Section 72−52−06, Repair−14 in the PW4000 Series CIR, PN 51A357
NOTE: You do not have to remove the plugs for this inspection.			
10	A maximum of 0.010 inch (0.254 mm) depth with no raised material	A maximum of 0.015 inch (0.381 mm) depth	Refer to Section 72−52−06, Repair−08 in the PW4000 Series CIR, PN 51A357

Stage 2 Turbine Intermediate Hub Inspection
Table 809 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
11	Scattered surface damage to a maximum of 0.003 inch (0.076 mm) depth with no raised material	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−06, Repair−08 in the PW4000 Series CIR, PN 51A357

Stage 2 Turbine Intermediate Hub Inspection
Table 809 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Turbine case See Figure 809 (Sheet 1) and Figure 809 (Sheet 2)			
Surface damage all the areas unless given differently as below	0.010 inch (0.254 mm) maximum depth. Damage must not have sharp edges or bottoms. Damage must not include corners.	0.020 inch (0.508 mm) maximum depth	Refer to Section 72-52-30, Repair-09 in the PW4000 Series CIR, PN 51A357
1	0.010 inch (0.254 mm) maximum depth	0.020 inch (0.508 mm) maximum depth	Refer to Section 72-52-30, Repair-09 in the PW4000 Series CIR, PN 51A357
2 Corner damage	Corner damage to 0.020 inch (0.508 mm) maximum depth	0.030 inch (0.762 mm) maximum depth	Refer to Section 72-52-30, Repair-09 in the PW4000 Series CIR, PN 51A357
3 Front flange, rear face, rear flange and front face	No damage is permitted that is not repaired. Raised material is not permitted.	Blend damage to a maximum of 0.010 inch (0.254 mm) depth	Refer to Section 72-52-30, Repair-09 in the PW4000 Series CIR, PN 51A357

Turbine Case Surface Damage Inspection
Table 810

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
4	Superficial damage only with the depth not to be more than the depth of the machine lines.	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−30, Repair−09 in the PW4000 Series CIR, PN 51A357
5, 6 Front flange, front face and rear flange, rear face	0.005 inch (0.127 mm) maximum depth. Raised material is not permitted.	Blend damage to a maximum of 0.010 inch (0.254 mm) depth	Refer to Section 72−52−30, Repair−09 in the PW4000 Series CIR, PN 51A357
		Wear more than 0.010 inch (0.254 mm) maximum depth can be repaired to a maximum of the minimum flange thickness	Refer to Section 72−52−30, Repair−03 and Repair−05 in the PW4000 Series CIR, PN 51A357
7	0.005 inch (0.127 mm) maximum depth	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−30, Repair−09 in the PW4000 Series CIR, PN 51A357
8, 9 Front and rear outer diameter mating diameter	All quantities of surface damage to a maximum of 0.005 inch (0.127 mm) depth. The length must not be more than the half	0.010 inch (0.254 mm) maximum depth	Refer to Section 72−52−30, Repair−09 in the PW4000 Series CIR, PN 51A357

Turbine Case Surface Damage Inspection
Table 810 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	of the contact width. Raised material is not permitted.		
		Wear more than 0.010 inch (0.254 mm) maximum can be repaired to a maximum of the minimum front lip thickness	Refer to Section 72-52-30, Repair-02 and Repair-04 in the PW4000 Series CIR, PN 51A357
10, 11 Hardface coat for:			
Wear and chipping	Wear and chipping that does not bare the base material is permitted	Worn or chipped coat that bares the base material must be repaired	Refer to Section 72-52-30, Repair-07 and Repair-08 in the PW4000 Series CIR, PN 51A357
Spalling	Spalling because of tooling is permitted. Spalling because of engine service is not permitted.	Spalling because of aging must be repaired. Wear can be repaired to a maximum limit.	
12 Bleed boss fillet radius cracks	Not permitted	See the repair	Refer to Section 72-52-30, Repair-26 in the PW4000 Series CIR, PN 51A357

Turbine Case Surface Damage Inspection
Table 810 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
13 Front flange bolthole crack	Not permitted	Radially outard less than 0.060 inch (1.524 mm) maximum length	Refer to Section 72−52−30, Repair−25 in the PW4000 Series CIR, PN 51A357
		Radially outward 0.060 inch (1.524 mm) and larger	Refer to Section 72−52−30, Repair−27 in the PW4000 Series CIR, PN 51A357

Turbine Case Surface Damage Inspection
Table 810 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 vane surface coat. See Figure 810 (Sheet 1), Figure 810 (Sheet 2) and Figure 810 (Sheet 3).			
Area A Ceramic Coat erosion/ chipping (Convex)	A maximum of 100 percent of the area	Replace the ceramic coat	Refer to Section 72-52-34, Repair-09 in the PW4000 Series CIR, PN 51A357
Area B Ceramic Coat erosion/ chipping (Concave and leading edge convex)	A maximum of 100 percent of the area	Replace the ceramic coat	Refer to Section 72-52-34, Repair-09 in the PW4000 Series CIR, PN 51A357
Area C Ceramic coat erosion/ chipping (Concave)	A maximum of 2.000 sq-in (1290. sq-mm) of total area	Replace the ceramic coat	Refer to Section 72-52-34, Repair-09 in the PW4000 Series CIR, PN 51A357
Area D Ceramic coat erosion/ chipping (Concave and convex)	Three areas to a maximum of 0.200 sq-in (129. sq-mm) for each concave and convex airfoil	Replace the ceramic coat	Refer to Section 72-52-34, Repair-09 in the PW4000 Series CIR, PN 51A357

Stage 2 Vane Coat Erosion and Chipping Inspection
Table 811

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area E Ceramic coat erosion/ chipping (Inner diameter and outer diameter platform)	A maximum of 75 percent of the area	Replace the ceramic coat	Refer to Section 72−52−34, Repair−10 in the PW4000 Series CIR, PN 51A357
Area F Ceramic coat erosion/ chipping (Inner diameter and outer diameter Platform)	Three areas maximum on each vane cluster to a maximum of 0.400 sq−in (258. sq−mm)	Replace the ceramic coat	Refer to Section 72−52−34, Repair−09 in the PW4000 Series CIR, PN 51A357
Area G Ceramic coat erosion/ chipping (Outer diameter platform)	A maximum of 100 percent of the area	Replace the ceramic coat	Refer to Section 72−52−34, Repair−09 in the PW4000 Series CIR, PN 51A357
Area H Ceramic coat erosion/ chipping (Outer diameter platform)	A maximum of 100 percent of the area	Replace the ceramic coat	Refer to Section 72−52−34, Repair−09 in the PW4000 Series CIR, PN 51A357

NOTE: Ceramic coat erosion and/or chipping is permitted in the above limits. There must be an undercoat (metal layer) on the damaged areas.

Stage 2 Vane Coat Erosion and Chipping Inspection
Table 811 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 vane surface inspection (See Figure 811)			
Concave side crack	One crack 0.787 inch (19.990 mm) maximum length. 0.020 inch (0.508 mm) maximum width. A crack in an area of burned base material is not permitted.	Not repairable	Remove from service
Trailing edge crack	One axial crack starts from the trailing edge to a maximum of 0.250 inch (6.350 mm) in length. However, a crack that extends through the concave and convex walls is not permitted.	See the repair	Refer to Section 72-52-34, Repair-11 in the PW4000 Series CIR, PN 51A357
Inner diameter and outer diameter platform cracks (Gaspath side)	Cracks are permitted, if the cracks do not extend into the platform to airfoil fillet radius and do not extend 0.236 inch (5.994 mm) maximum of platform edge. Cracks must not form	See the repair	Refer to Section 72-52-34, Repair-11 in the PW4000 Series CIR, PN 51A357

Stage 2 Vane Surface Inspection
Table 812

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
	a closed loop with imminent material liberation.		
Outer diameter platform to airfoil fillet radius base material burning and erosion	Not permitted	Not repairable	Remove from service
Leading edge crack	One leading edge crack to a maximum of 0.400 inch in length and no more than 0.020 inch (0.508 mm) width	Not repairable	Remove from service
Leading edge base material burning	Total burning to a maximum of 0.400 inch in diameter or 0.125 sq−in (81. sq−mm)		Remove from service
Airfoils and leading edge round bottom nicks and dents	All quantities to 0.040 inch (1.016 mm) in depth. Dents to a maximum of 0.250 inch (6.350 mm) in diameter or length other than at trailing edge.	Not repairable	Remove from service

Stage 2 Vane Surface Inspection
Table 812 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Gaspath side inner diameter and outer diameter platforms round bottom nicks and dents	All quantities to a maximum of 0.060 inch (1.524 mm) in depth	Not repairable	Remove from service
Trailing edge round bottom nicks and dents	Dents less than 0.375 inch (9.525 mm) maximum diameter are permitted		Remove from service
Trailing edge plugged slot	Not permitted	All quantities can be cleaned. Vane slots must be fully open and vane must obey airflow limits.	Refer to Section 72−52−00, Cleaning−04 in the PW4000 Series CIR, PN 51A357
Inner diameter and outer diameter platform base material burning and erosion	A maximum of 0.010 inch (0.254 mm) in depth to 0.600 inch (15.240 mm) diameter or 0.283 sq−in (183. sq−mm) maximum		Remove from service
Concave and convex airfoil surfaces burning and erosion	A maximum of 0.010 inch in depth to 0.200 sq−in (129. sq−mm) for each airfoil surface		Remove from service

Stage 2 Vane Surface Inspection
Table 812 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Trailing edge area base material burning and erosion (Concave and convex side)	0.125 inch (3.175 mm) axially from trailing edge and 0.300 inch (7.620 mm) in width		Remove from service

Stage 2 Vane Surface Inspection
Table 812 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 blade surface damage. See Figure 812 (Sheet 1) and Figure 812 (Sheet 2).			
Dents general:	Only round bottom dents are permitted on the blade airfoil All dents must have a length to depth ratio of ten to one minimum		
Area A:			
Number	Eight round bottom dents	Two	Refer to Section 72-52-08, Repair-01 and Repair-14 in the PW4000 Series CIR, PN 51A357
Size	0.002 inch (0.051 mm) in maximum depth and 0.150 inch (3.810 mm) maximum diameter	0.010 inch (0.254 mm) depth and 0.075 inch (1.905 mm) maximum diameter	
Area B:			

Stage 2 Blade Surface Inspection
Table 813

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Number	Eight round bottom dents	Four on each side	Refer to Section 72−52−08, Repair−01 and Repair−14 in the PW4000 Series CIR, PN 51A357
Size	0.002 inch (0.051 mm) in maximum depth and 0.150 inch (3.810 mm) maximum diameter	0.010 inch (0.254 mm) in maximum depth and 0.150 inch (3.810 mm) maximum diameter	
Area C:			
Number	Two on each side	Two on each side	Refer to Section 72−52−08, Repair−01 and Repair−14 in the PW4000 Series CIR, PN 51A357
Size	0.005 inch (0.127 mm) in maximum depth	0.010 inch (0.254 mm) in maximum depth	
Area D:			
Number	Two	Two	Refer to Section 72−52−08, Repair−01 and Repair−14 in the PW4000 Series CIR, PN 51A357

Stage 2 Blade Surface Inspection
Table 813 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Size	Dent must not block a single air discharge port by more than 50 percent	Dent must not block a single air discharge port by more than 50 percent	
Area E:			
Number	Four round bottom dents	Not repairable	Remove from service
Size	0.001 inch (0.025 mm) maximum depth and 0.075 inch (1.905 mm) maximum diameter		
Area F:	All quantities to a maximum of 0.005 inch (0.127 mm) depth and 0.075 inch (1.905 mm) maximum diameter Or	All quantities to a maximum of 0.005 inch (0.127 mm) depth and 0.075 inch (1.905 mm) maximum diameter	Refer to Section 72−52−08, Repair−01 and Repair−14 in the PW4000 Series CIR, PN 51A357
	One round bottom dent 0.005 inch (0.127 mm) maximum depth and 0.150 inch (3.810 mm) maximum diameter	Two dents to a maximum of 0.015 inch (0.381 mm) in depth and 0.125 inch (3.175 mm) maximum axial length and 0.250 inch (6.350 mm) maximum radial length.	Refer to Section 72−52−08, Repair−01 and Repair−14 in the PW4000 Series CIR, PN 51A357
Areas of missing coat, burning or erosion in:			

Stage 2 Blade Surface Inspection
Table 813 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area A and Area F	Leading edge damage 0.200 inch (5.080 mm) maximum diameter or 0.031 sq-in (20. sq-mm)		Remove from service
Crack in: See Figure 812 (Sheet 3)			
Area G	Not permitted		Remove from service
Area H	Not permitted		Remove from service
Area J	Axial or radial cracks are permitted if there is no breakthrough, intersecting cracks or imminent material liberation		Remove from service
Trailing edge cooling air slot blockage Area G, Area H and Area J	Not permitted		Remove from service
Full blade surface for the signs of sulfidation (corrosion) pitting	Not permitted		Remove from service

Stage 2 Blade Surface Inspection
Table 813 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Airfoil growth as shown by necking down or localized thinning of airfoil in mid−span region, bending or movement of airfoil in rear direction, trailing edge cooling slot cracks or other signs of obvious blade growth	Not permitted		Remove from service

Stage 2 Blade Surface Inspection
Table 813 (Continued)

ENGINE GENERAL - HIGH PRESSURE TURBINE (HPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 blade retaining plate (See Figure 813)			
Examine all surfaces for:			
Cracks	Not permitted	Not repairable	Remove from service
Corrosion	Not permitted	Not repairable	Remove from service
Examine all the areas for surface damage:			
1	Not permitted	0.010 inch (0.254 mm) maximum depth	Refer to Section 72-52-23, Repair-01 in the PW4000 Series CIR, PN 51A357
2	0.004 inch (0.102 mm) maximum	0.010 inch (0.254 mm) maximum depth, unless given differently	Refer to Section 72-52-23, Repair-01 in the PW4000 Series CIR, PN 51A357
3 Bent knife-edge seal	Bends are permitted if the bends have 0.020 inch (0.508 mm) maximum depth and 0.020 inch (0.508 mm) minimum bend radii. Bends must be smooth		

Stage 2 Blade Retaining Plate Inspection
Table 814

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)	and continuous with no sharp edges. No cracks are permitted.		
4 Knife−edge minor nicks, scratches and dents	Not permitted	A maximum of four local areas are permitted at 1.000 inch (25.400 mm) minimum separation, 0.020 inch (0.508 mm) maximum depth, 1.000 inch (25.400 mm) maximum length	Refer to Section 72−52−23, Repair−01 in the PW4000 Series CIR, PN 51A357

CAUTION: DO NOT STRAIGHTEN A BENT KNIFE−EDGE SEAL OR DAMAGE TO THE PART CAN OCCUR.

Stage 2 Blade Retaining Plate Inspection
Table 814 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 1 duct support assembly (See Figure 814)			
1 Wear	0.005 inch (0.127 mm) maximum depth	0.025 inch (0.635 mm) maximum depth	Refer to Section 72-52-31, Repair-07 in the PW4000 Series CIR, PN 51A357
		0.050 inch (1.270 mm) maximum depth	Refer to Section 72-52-31, Repair-02 in the PW4000 Series CIR, PN 51A357
Examine all the surfaces for:			
Cracks	Not permitted	Not repairable	Remove from service
Nicks, dents and scratches	0.005 inch (0.127 mm) maximum depth with no sharp edges or bottoms. No damage is permitted on the corners.	0.015 inch (0.381 mm) maximum depth must be blended	Refer to Section 72-52-31, Repair-03 in the PW4000 Series CIR, PN 51A357
Corrosion	No corrosion is permitted	Blend all corrosion	Refer to Section 72-52-31, Repair-03 in the PW4000 Series CIR, PN 51A357

Stage 1 Duct Support Assembly Inspection
Table 815

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Locating pins	Missing pins are not permitted	Replace loose, sheared, missing or deformed pins	Refer to Section 72−52−31, Repair−01 in the PW4000 Series CIR, PN 51A357
Feather seal tabs for damage, bent or missing material	Not permitted	Missing material can be blended	Refer to Section 72−52−31, Repair−03 in the PW4000 Series CIR, PN 51A357

Stage 1 Duct Support Assembly Inspection
Table 815 (Continued)

ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 duct support assembly (See Figure 815)			
Examine all the surfaces for:			
Cracks	Not permitted	Not repairable	Remove from service
Nicks, dents and corrosion	0.020 inch (0.508 mm) maximum depth	0.050 inch (1.270 mm) maximum depth	
Local wear and galling	0.010 inch (0.254 mm) maximum depth	0.040 inch (1.016 mm) maximum depth	Refer to Section 72−52−37, Repair−02 in the PW4000 Series CIR, PN 51A357
1 Pins	Loose, sheared, deformed or missing pins are not permitted	Replace loose, sheared, deformed or missing pins	Refer to Section 72−52−37, Repair−01 in the PW4000 Series CIR, PN 51A357
2 Wear	No damage is permitted	0.030 inch (0.762 mm) maximum depth	Refer to Section 72−52−37, Repair−02 and Repair−05 in the PW4000 Series CIR, PN 51A357

Stage 2 Duct Support Assembly Inspection
Table 816

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3 Missing feather seal wall material	0.050 inch (1.270 mm) maximum width and 0.150 inch (3.810 mm) length is permitted on the rear of the support with no sharp edges adjacent to the seal mating groove. No crack is permitted. Lightly blend to remove sharp edges. Examine for cracks by Section 70−33−00, SPOP 70 (normal sensitivity) in the Standard Practices Manual, PN 585005.		Remove from service

Stage 2 Duct Support Assembly Inspection
Table 816 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
All surfaces for: (See Figure 816)			
Stage 1 duct band segment			
Cracks	Not permitted	1.000 inch (25.400 mm) maximum length	Refer to Section 72−52−33, Repair−01 in the PW4000 Series CIR, PN 51A357
Wear and galling in:			
Area A	All quantities if 0.014 inch (0.356 mm) minimum wall thickness is kept	Not repairable	Remove from service
Area B	All quantities of missing or thinning parent material	Not repairable	Remove from service
All other areas	0.015 inch (0.381 mm) maximum depth	Not repairable	Remove from service
Shiplap tab deformation	All quantities if part can be assembled		Remove from service
Plugged cooling air holes	All holes must be fully open		Clean plugged holes with a 0.029 inch (0.737 mm) diameter wire

Stage 1 Duct Band Segment Inspection
Table 817

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 2 vane inner diameter and outer diameter platform for: See Figure 817			
Missing feather seals	A maximum of three feather seals can be missing	All quantities	Replace the missing seals

Stage 2 Vane Platform Feather Seal Inspection

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-01

Task 72-00-53-020-001:

1. Remove Low Pressure Turbine With Shaft

NOTE: See Figure 301 for part/assembly removal procedure sequence.

NOTE: This procedure is for the removal of the low pressure turbine with the turbine exhaust case previously removed.

NOTE: See 72-00-53, Removal-08 (Task 72-00-53-020-002) for the procedure to remove the low pressure turbine with the turbine exhaust case installed.

A. Prerequisites

(1) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-001).

(2) Remove The Turbine Exhaust Case. Refer to 72-00-54, Removal-01 (Task 72-00-54-020-001).

(3) Disconnect/Remove External Parts For Access To The Low Pressure Turbine (LPT). Refer to 72-00-53, Removal-03 (Task 72-00-53-020-003).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)

PWA 76270	Stand (Optional To PWA 87330)
PWA 80187	Wrench, Mechanical (Use With Mechanical Wrench)
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85298	Puller, Jackscrew
PWA 85299	Adapter, Wrench (Use With Mechanical Wrench)
PWA 85300	Adapter, Wrench (Use With Mechanical Wrench)
PWA 85306	Puller, Knocker
PWA 85331	Retainer, Rear
PWA 85430	Sleeve, Adapter (Optional To PWA 86424)
PWA 85456	Retainer, Front (Optional To PWA 85996)
PWA 85514	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85515	Adapter (Use With Hydraulic Wrench)
PWA 85562	Sleeve, Support (Used With PWA 25096 And PWA 76270 Stand)
PWA 85769	Fixture (Install/Remove)
PWA 85785	Adapter, Piloting
PWA 85996	Retainer, Front (Optional To PWA 85456)
PWA 86210	Adapter , Piloting
PWA 86424	Sleeve, Adapter
PWA 86604	Stand, Transport (Optional, To Store And Transport PWA 85769 Fixture)
PWA 87330	Stand
PWA 87347	Sleeve, Support (Used With PWA 87330 Stand)
PWA 88204	Guide, Piloting
PWA 102460	Adapter, Wrench (Use With Mechanical Wrench)
PWA 102727	Support
PWA 103636	Base, Support

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

C. Procedure

(1) Position and adjust the PWA 102727 Fan Case Support to engage and hold the fan inlet case at Flange "A" at the 6 o'clock location. If it is necessary because of the height of the engine in the pedestals, first install the Fan Case Support (PWA 102727) in a PWA 103636 Base

Support. Attach the Fan Case Support (PWA 102727) to the Base Support (PWA 103636) with the three detail bolts and nuts.

NOTE: If necessary several Base Supports (PWA 103636) can be stacked together. They must be attached to each other with the three detail bolts and nuts.

(2) Align boltholes and install PWA 86424 Sleeve or PWA 85430 Sleeve onto rear face of low pressure turbine shaft. Secure sleeve with eight bolts (302/1). See Figure 302.

(3) Install PWA 85331 Retainer to rear of low pressure turbine. See Figure 302.

  (a) Using hoist, connect PWA 28657 Sling to lifting rings of retainer.

  (b) Position retainer to rear of low pressure turbine.

  (c) Align lower bolthole in forward right side of retainer with No. 21 bolthole from locating pin at 6 o'clock position in rear flange of low pressure turbine case.

  (d) Locate No. 21 bolthole on right side, rear flange of turbine case, from locating pin at 6 o'clock position. Align lower right bolthole in front side of fixture with previously located No. 21 bolthole. Secure fixture to rear flange with 48 washers (302/3) and screws (302/4).

  (e) Tighten eight hand knobs (302/2) to secure inner hub of fixture to PWA 86424 Sleeve or PWA 85430 Sleeve as applicable.

  (f) Remove sling. Install sling with two PWA 76154 Adapters to the forward spools on the rear retainer.

(4) Remove shims between outer shroud of 6th stage LPT blades and air sealing ring segments.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−01

(5) Remove key washer retaining ring (303/1) and retaining nut key washer (303/2) securing turbine shaft plug (303/3) at front of LPC/LPT coupling. Remove plug using PWA 85306 Puller. Discard packing (303/4). See Figure 303.

(6) Remove retaining ring (304/1) and key washer (304/2) securing turbine shaft nut (304/3) to low pressure turbine shaft. See Figure 304.

(7) For operators that use the mechanical wrench, remove the turbine shaft nut as follows.

NOTE: See the following step to remove the turbine shaft nut with the optional hydraulic wrench.

(a) Install PWA 102460 Adapter or PWA 85299 Adapter into LPC/LPT coupling. See Figure 305.

1 Loosen wing nuts (305/1) and slide three clamps (305/2) radially inward.

2 Loosen wing nuts (305/1) and slide three clamps (305/2) radially inward.

3 Align keys in adapter with internal slots in coupling and install adapter in coupling. Index adapter as necessary to seat keys in slots in coupling. Slide three clamps radially outward to engage lugs of coupling. Tighten wing nuts to secure clamps.

(b) Install PWA 85300 Wrench, smaller splined end first, into center of PWA 102460 Adapter or PWA 85299 Adapter. Align spline of wrench with spline in ID of turbine shaft nut. Push wrench inward to seat on face of nut.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85300 Wrench. Align anti−torque pins in wrench with bushings in adapter and seat wrench against adapter face. See Table 301 for mechanical wrench options.

PWA Mechanical Wrench	PWA Torque Multiplier
45418	45419
29614, or 80187	45419, or 80651

Mechanical Wrench Options
Table 301

CAUTION: PWA 80651 TORQUE MULTIPLIER MUST NOT BE USED WITH PWA 45418 WRENCH OR DAMAGE TO WRENCH MAY OCCUR.

(d) Actuate wrench to remove nut from shaft.

NOTE: Wrenches may be actuated using air torque multipliers to speed up removal of nut per Table 301.

(e) Remove wrenches and adapter from coupling.

(f) Remove nut from turbine shaft.

(8) For operators that use the hydraulic wrench, remove the turbine shaft nut as follows: See Figure 306.

(a) Align boltholes and position PWA 85515 Adapter to rear face of PWA 33732 Wrench or PWA 18872 Wrench. Secure adapter with eight bolts (306/3).

(b) Using hoist, position wrench and adapter assembly into front end of LPC/LPT coupling. Align teeth of adapter with slots in coupling and slide three clamps (306/1) outward to engage lugs of coupling. Tighten wing nuts (306/2) to secure adapter to coupling.

NOTE: PWA 28815 Cart or PWA 75046 Cart may be used to transport PWA 33732 Wrench or PWA 18872 Wrench and PWA 28814 Pump or PWA 29510 Pump.

(c) Install PWA 85514 Wrench, smaller splined end first, into center of PWA 33732 Wrench or PWA 18872 Wrench. Align spline of wrench with spline in turbine shaft nut. Push wrench inward to seat on face of nut.

(d) Connect PWA 28814 Electric Pump or PWA 29510 Hand Pump to wrench.

(e) Actuate wrench to remove nut from shaft.

(f) Remove wrenches and adapter from coupling.

(g) Remove nut from turbine shaft.

(9) Remove Flange N lockwire, bolts, nuts and brackets. Refer to 72−00−53, Removal−20 (Task 72−00−53−020−020).

(10) Install PWA 85769 Fixture into front end of front compressor drive turbine shaft. See Figure 307.

(a) Thread plug end of shaft (307/1) into end of turbine shaft until plug bottoms on shoulder of shaft.

(b) Guide body (307/4) and attach parts over previously installed shaft (307/1). Using dowel pin (307/2), retract locking pin. Rotate assembly to position locator plate (307/3) behind lugs at front end of low pressure turbine coupling. Using dowel pin (307/2), release spring loaded locking pin to lock fixture to coupling.

(c) Guide hydraulic cylinder (307/5), threaded end first, over shaft and thread cylinder into fixture.

(d) Connect PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to hydraulic cylinder.

(11) Install jackscrews into threaded holes in Flange N.

(12) Apply hydraulic pressure to separate turbine shaft from LPC/LPT coupling and tighten jackscrews to break fit between turbine cases.

(13) Using dowel pin (307/2), retract locking pin into housing. Rotate body (307/4) to position lugs of locator plate between lugs of LPC/LPT coupling. Remove body from coupling. Unthread shaft (307/1) from turbine shaft.

(14) Remove jackscrews from turbine case Flange N.

(15) Thread the puck end of PWA 88204 Guide into the front end of the turbine shaft. See Figure 308.

NOTE: The guide can be separated into two parts if required.

(16) If the fan nut and the turbine shaft coupling are in place, slide the PWA 85785 Adapter, clamp end first, over the PWA 88204 Guide. Install the adapter in the ID of the fan nut. Use the detail clamps to attach the adapter to the coupling lugs. See Figure 308.

(17) Optional, if the fan nut and turbine shaft coupling are not in place, slide the PWA 85785 Adapter, clamp end first, over the PWA 888204 Guide. Install the adapter in the 11.120 inch (282.448 mm) diameter of the fan hub. Use the detail clamps to attach the adapter to the flange.

(18) Optional, if the low pressure compressor is not in place, slide the PWA 86210 Adapter, clamp end first, over the PWA 88204 Guide. Use the detail clamps to attach the adapter to the No. 1 bearing support. See Figure 309.

(19) Move low pressure turbine section rearward approximately 12 inches (304.80 mm). If applicable, retain V−seal gasket located between cases until such time as the low pressure turbine is removed from engine.

(20) Align the center hole in PWA 85996 Retainer or PWA 85456 Retainer (310/3) with the dowel pin hole in the turbine case. Attach the retainer to the front flange of the turbine case at 6 and 12 o'clock locations with four bolts (310/2) and nuts (310/1). Attach the clamps of the retainer to the front compressor drive turbine shaft with two bolts (310/4). See Figure 310.

(21) Use a second hoist and install a nylon sling around the turbine shaft. Take up the slack in the sling.

(22) Move the nylon sling as required and move the assembly rearward. Remove the turbine from the engine.

(23) Remove the V−seal gasket located between the cases, if applicable.

(24) Remove the PWA 85785 Adapter or PWA 86210 Adapter as applicable.

(25) Remove the guide from the turbine shaft.

(26) Install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096 Stand or PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Position details−1 and −2 forward and details−3 and −5 rearward with details−2 and −3 down. Tighten the set screws to attach the sleeve details to the stand. See Figure 311.

(27) Place low pressure turbine in the stand. Tighten clamps around turbine shaft and slide chocks inward to contact rear flange of turbine case.

NOTE: Chocks are utilized as a safety device and do not support any portion of assembly.

(28) Remove hoists, sling and adapters from spools low pressure turbine retainer.

(29) Remove nylon sling and hoist from turbine shaft.

(30) Remove turbine shaft (classified) spacer using PWA 85298 Puller. See Figure 312.

(a) Loosen bolts and slide puller legs inward.

(b) Position puller over LPT shaft and slide legs outward, locating legs in puller groove of spacer. Tighten bolts to secure legs.

(c) Hold threaded bolt at center of puller and turn large hex head nut to remove spacer from end of turbine shaft.

(31) Lubricate the spline area at the front end of the turbine shaft with Engine Oil P03−001. If the shaft is not coated in the area forward or rearward of the spline, lubricate these areas also.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−02

Task 72−00−53−020−001−002:

1. Remove Low Pressure Turbine With Shaft (Hydraulic Wrench) − Deleted

A. Procedure

(1) This procedure is relocated to 72−00−53, Removal−01 (Task 72−00−53−020−001).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-03

Task 72-00-53-020-003:

1. Remove External Plumbing Prior To Low Pressure Turbine Removal

   A. Equipment And Materials Necessary - None

   B. Procedure
   See Figure 301, Figure 302, Figure 303 and Figure 304.

      (1) Remove turbine case cooling (TCC) air valve control cable as follows.

         (a) Remove lockwire and disconnect forward end of cable from actuator located at approximately 2 o'clock position on HPC.

         (b) Remove bolt and nut securing cable rod end bearing to value idler arm at HPT case cooling air shutoff valve.

         (c) Remove lockwire from the jamnuts at the cable rear support bracket and loosen the jamnuts.

         (d) Remove bolts, nuts and clamps securing cable. Remove cable from engine.

      (2) Remove turbine case cooling (TCC) air shutoff valves as follows.

         (a) Remove bolts and screw securing both valve flanges to upper support bracket and turbine case cooling duct. Remove duct from engine. If equipped, remove metering plate or blank-off plate.

         (b) Remove bolts, washers and nuts securing braces and struts to Flange M and N brackets.

         (c) Remove bolts, spacers and nuts securing braces and turbine pull control cable bracket to upper and lower support brackets. Remove braces, struts and bracket from engine.

         (d) Remove bolts and nuts securing upper support bracket and upper link to Flange N and LPT case brackets. Remove link and bracket from engine.

         (e) Remove bolts and nuts securing lower flange of HPT case cooling air shutoff valve to lower support bracket. Remove both valves from engine and install protective closures.

(f) Remove bolts and nuts securing lower support bracket and lower link to Flange N and LPT case brackets. Remove link and bracket from engine. Install protective closures.

(3) Remove turbine vane cooling air duct (upper right) (AP01) as follows.

(a) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 1 o'clock position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove lockwire, bolts and bracket securing front flange of tube to boss on the HPC case at approximately the 2 o'clock position.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire and bolts that attach the front flange of the cooling air duct to the flange of the turbine vane cooling air valve on the HPC case at approximately the 2 o'clock position.

(d) Remove the lockwire and bolts that attach a clamp to the support on the diffuser case. Remove the clamp.

(e) Remove the cooling air duct from the engine.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Remove and discard the gasket from the boss on the HPC case.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove and discard the gasket from the front flange of the duct.

(h) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−315), Remove and discard the gasket (Post SB PW4ENG 75−57) from the boss on the HPT case.

(i) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72−315), Remove and discard the metering orifice seal plate from the boss on the HPT case.

(j) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the metering orifice seal plate from the boss on the HPT case and discard the plate.

(k) Install protective closures.

(4) Remove turbine vane cooling air duct (upper left) (AP04) as follows.

(a) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 9 o'clock position.

(b) Remove the bolts that attach the front flange of the cooling air duct to the flange of the turbine vane cooling air valve on the HPC case. Remove and discard the gasket.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolts, nuts and clamp that attach the cooling air duct to the bracket on the diffuser case pad and remove the duct from the engine. Discard the gasket (Engines with SB PW4ENG 72−315 or SB PW4ENG 75−57) or metering orifice seal plate (Engines without SB PW4ENG 72−315 or SB PW4ENG 75−57).

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolts, nuts and clamp that attaches the cooling air duct to the bracket on the diffuser case pad and remove the duct from the engine. Discard the gaskets.

(e) Install protective closures.

CAUTION: REMOVE BORESCOPE PLUG (IF EQUIPPED) FROM LOWER LEFT TURBINE COOLING TUBE ELBOW PRIOR TO REMOVAL OF TUBE. FAILURE TO DO SO COULD RESULT IN DAMAGE TO PLUG.

(5) Remove the turbine vane cooling air duct (lower left) (AP03) as follows.

(a) For engines equipped, remove lockwire and three bolts securing borescope plug to rear elbow. If necessary, use two jackscrews (.190−32 thread) and remove borescope plug evenly.

(b) Remove the lockwire and bolts that attach the rear flange of the cooling air duct to the boss on the HPT case at approximately the 7 o'clock position.

(c) Remove the lockwire and bolts that attach the front flange of the cooling air duct and tube bracket to the boss on the HPC case.

(d) Remove the bolt and nut that attach the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air duct (AP03).

NOTE: The spray shield for the manifold can stay with the clamp.

(e) Loosen the clamp bolt that attaches the No. 4 bearing oil pressure tube (front) (LP15) to the bracket attached at the front flange of the duct. Move the bracket to permit removal of the cooling air duct.

(f) Remove bolts, nuts and clamp that attaches the cooling air duct to the bracket on the diffuser case pad and remove the duct from the engine. position and remove tube from engine.

(g) Remove and discard the gasket from the boss on the HPC case.

(h) FOR THESE MODELS: 4152, 4156A, 4158
Remove and discard the metering orifice seal plate from the boss on the HPT case (Engines with SB PW4ENG 72−315 and without SB PW4ENG 75−57).

(i) FOR THESE MODELS: 4152, 4156A, 4158
Remove and discard the gasket from the boss on the HPT case (Engines without SB PW4ENG 72−315 and with SB PW4ENG 75−57).

(j) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove and discard the metering orifice seal plate from the boss on the HPT case.

(k) Install protective closures.

(6) Remove turbine case cooling (TCC) HPT manifolds (AC21) through (AC28) as follows.

(a) Remove bolts securing manifolds to manifold (collector) at approximately 3 o'clock position.

(b) Remove bolts, nuts and clamps securing upper front manifold to brackets (three locations). Rotate to disengage manifold from collector and remove from engine. Install protective closures.

(c) Remove two end bolts and nuts securing upper and lower manifold supports (six locations) to Flange M and N brackets. Rotate to disengage upper and lower (center two) manifolds from manifold (collector) and remove from engine. Install protective closures.

(d) Remove bolts, nuts and clamps securing upper and lower rear manifolds (six locations). Rotate and disengage manifolds from manifold (collector) and remove from engine. Install protective closures.

(e) Remove bolts and nuts securing support brackets to Flange M and N and remove brackets from engine.

(7) Remove HPT manifold (collector) assembly.

(a) Remove bolt, nut, spacer, screw and clamps securing manifold (collector) to Flange M bracket. Remove manifold (collector) from engine and install protective closures.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-04

Task 72-00-53-050-002:

1. Remove Turbine Case Cooling Manifold (Collector)

   A. Equipment And Materials Required - None

   B. Procedure

   See Figures 301 and 302.

   (1) Remove bolts securing cooling air manifolds (AC01) through (AC14) to upper and lower sides of turbine case cooling manifold (collector).

   (2) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
   Remove the bolts, nuts and clamps that attach the cooling air manifolds to brackets on Flange P at the six locations.

   (3) FOR THESE MODELS: 4152, 4156A, 4158
   Remove the bolts, nuts and clamps that attach the cooling air manifolds to brackets on Flange P at the six locations.

   (4) Remove bolts and nuts securing cooling air manifold brackets to brackets on Flange N and boss on case.

   (5) Disengage lower cooling manifolds from manifold (collector) by sliding manifolds downward away from manifold (collector).

   (6) Disengage upper cooling manifolds from manifold (collector) by sliding tubes upward away from manifold (collector).

   (7) FOR THESE MODELS: 4152, 4156A, 4158
   Remove the upper and lower cover assembly from the rear (No. 7) of the manifold (collector) (Engines with SB PW4ENG 75-53).

   (8) Remove bolts securing manifold (collector) to support bracket and LPT cooling valve flange.

   (9) Remove bolts and clamps securing inboard bracket on manifold (collector) to bracket on Flange N.

   (10) Remove bolts, nuts, and clamps securing rear of manifold (collector) to brackets on Flange P and remove manifold from engine.

(11) Install protective closures.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-05

Task 72-00-53-050-003:

1. Remove Turbine Case Cooling Manifolds

   A. Prerequisites

      (1) Remove EEC thermocouple and airframe cable (W6) as necessary by 72-00-54, Removal-09 (Task 72-00-54-050-006).

   B. Equipment And Materials Required - None

   C. Procedure

      See Figures 301, 302, 303, 304 and 305.

      (1) (Pre SB PW4ENG 79-76) Remove No. 4 bearing oil pressure tube assembly (LP16) as follows. See Figure 301.

         (a) Remove the clamps securing spray shield, to tube connection and if equipped a bracket, forward of Flange M at approximately 10 o'clock position on diffuser case. Remove the spray shield from the engine. Remove lockwire and disconnect tube nut from tube adapter.

         (b) Remove clamp securing spray shield to rear tube connection on exhaust case and remove spray shield. Remove lockwire and disconnect tube nut.

         (c) Remove bolts, nuts, and clamps securing tube to brackets on Flanges M, N, and P at approximately 10 o'clock position.

         (d) Remove bolt, nut, spacer, and clamps securing tube to adjacent scavenge tube rearward of Flange N. Remove tube from engine.

      (2) (Post SB PW4ENG 79-76) Remove No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. See Figure 305.

         (a) Remove clamps and the tube spray shields at the (LP48) tube to the strainer housing connection, at the (LP47) tube to the (LP48) tube connection and at the (LP47) tube to the (LP15) tube connection. See Views G, CA and LA.

         (b) Remove clamps, bolts and nuts as shown in Views M, N, B1, P, R and F.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−05

(c) Remove the (LP48) tube from the strainer housing and the (LP47) tube. See Views G and CA.

(d) Remove the element housing from the tube nut at approximately the 7 o'clock position. See View G.

(e) Remove the No. 4 bearing strainer element from the element housing. See View G.

(f) Remove and discard packing from the groove in the strainer element. See View G.

(g) Remove bolts and clamps. See Views U, T, and S.

(h) Remove the coupling nut that attaches (LP15) tube to the (LP47) tube. See View LA.

(3) (Pre SB PW4ENG 79−75) Remove (rear) No. 4 bearing oil scavenge tube assembly (LR06) as follows.

(a) Remove lockwire and disconnect rear scavenge tube elbow from exhaust case internal tube at approximately 10 o'clock position.

(b) Remove bolt, nut, and clamp securing spray shield to bracket on Flange M. Remove clamp securing forward end of shield to tube and remove spray shield.

(c) Remove lockwire and disconnect tube nut at Flange M from tube adapter.

(d) Remove bolt, nut, and clamp securing tube to bracket on Flange P.

(e) Remove bolts, nuts, and clamps securing tube to brackets on Flange N. Remove tube from engine.

(4) (Post SB PW4ENG 79−75 and Pre SB PW4ENG 79−76 only) Remove (rear) No. 4 bearing scavenge tube assembly (LR06) as follows.

(a) Remove hose clamp securing the tube shield to the bracket inboard side of Flange M at approximately 7 o'clock position. Remove the lockwire and disconnect the (LR05) hose and tube assembly nut from the (LR06) tube coupling.

(b) Remove lockwire and disconnect tube elbow from exhaust case internal tube nut at approximately 10 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flange N and P brackets. Remove tube from engine and install protective closures.

(d) Remove bolts, nuts and clamp bracket attached to Flange M and N brackets at approximately 7 o'clock position.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that secures the tube to the adjacent PT4.95 tube assembly (Post SB PW4ENG 72−134).

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that attaches the tube to the adjacent PT4.95 tube assembly.

(g) Remove bolt, nut, and clamp securing tube to adjacent tube between Flange M and Flange P. Remove tube from engine and install protective closures.

(5) (Post SB PW4ENG 79−76) Remove (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows. See Figure 305.

(a) Remove clamps and the tube spray shields at the (LR21) tube to (LR22) tube connection and at the (LR05) tube to the (LR21) tube connection. See Views E and DE.

(b) Remove clamps on the (LR22). See Views A, B, C and D.

(c) Remove the (LR22) tube from the (LR21) tube and the port for the internal tube on the turbine exhaust case. See Views E and AP.

(d) Remove clamps, nuts and bolts that secure (LR21) tube. See Views F, O, Q and R.

(e) Remove the (LR21) tube from the (LR05) tube. See View DE.

(6) (Pre SB PW4ENG 79−76) Remove No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Remove lockwire and disconnect oil vent tube assembly from adapter on turbine exhaust case at approximately the 7 o'clock position.

(b) Remove lockwire and disconnect tube nut at tube connection just rearward of Flange M.

(c) Remove bolt, nut, and clamp that attach the tube to bracket on Flange N.

(d) Remove bolts, nuts, and clamps that attach the tube to Flange P brackets.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that attach the tube to the adjacent PT4.95 tube assembly (Post SB PW4ENG 72−134).

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that attach the tube to the adjacent PT4.95 tube assembly.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove bolt, nut, and clamp that attach the tube to the adjacent tube between Flange M and Flange P. Remove the tube from the engine and install protective closures.

(7) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Pre SB PW4ENG 79−76) Remove the (rear) EEC PT4.95 pressure tube assembly (AS02) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove lockwire from tube nut securing tube to tee (water drain) on PT4.95 manifold, rearward of Flange P at approximately 6 o'clock position and disconnect tube nut (Pre SB PW4ENG 72−134).

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position (Post SB PW4ENG 72−134).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Remove bolt, nut, and clamp that secures the tube to the Flange P bracket at approximately the 7 o'clock position (Pre SB PW4ENG 72−134).

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position.

(e) Remove lockwire from tube connection at Flange N at approximately the 8 o'clock position and disconnect tube nut from tube adapter.

(f) Remove the tube from the engine and install protective closures.

(8) (Post SB PW4ENG 79−76) Remove the (rear) No. 3 bearing oil vent tube assembly (LD02) and the (rear) EEC PT4.95 pressure tube assembly (AS02) as follows. See Figure 305.

(a) Remove clamps, nut and bolts from the (AS27) tube, the (LD02) tube, the (AS02) tube and the (LP48) tube. See Views H, I, J, K and L,

(b) Remove the bolt that attaches the (AS02) tube to the bracket. See View G.

(c) Remove the (AS02) tube from the (AS03) and (AS27) tubes. See (Sheet 1).

(d) Remove the (LD02) tube from the (LD01) tube and to the turbine exhaust case. See (Sheet 1).

(9) Remove all bolts securing LPT (TCC) manifolds (AC01) through (AC14) (upper and lower) to manifold (collector).

(10) Remove bolts and nuts securing cooling air manifold brackets to brackets on Flange N.

NOTE: Bolt and nut at approximately the 8 o'clock position holds clamp supporting HPT manifold.

(11) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolts, nuts, spacers and clamps that attach the rear mounts of the cooling manifolds to brackets on Flange P (Pre SB PW4ENG 75−50).

(12) FOR THESE MODELS: 4152, 4156A, 4158
Remove the bolts, nuts and clamps that attach the rear mounts of the cooling manifolds to brackets on Flange P (Post SB PW4ENG 75−50).

(13) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the bolts, nuts and clamps that attach the rear mounts of the cooling manifolds to the brackets on Flange P.

(14) Rotate lower half of cooling air manifolds around LPT case to disengage from manifold (collector). Remove lower cooling manifolds from engine.

(15) Rotate upper half of cooling air manifolds around LPT case to disengage from manifold (collector). Remove upper cooling manifolds from engine.

(16) FOR THESE MODELS: 4152, 4156A, 4158
Remove the upper and lower cover assembly from the rear (No. 7) of the manifold (collector) (Post SB PW4ENG 75−53).

(17) Install protective covers.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-06

Task 72-00-53-050-004:

1. Remove Turbine Case Cooling (TCC) Air Valve Control Cable

A. Equipment And Materials Required - None

B. Procedure
See Figure 301.

(1) Remove the lockwire from the forward end of the turbine case cooling (TCC) air valve control cable and disconnect the cable coupling nut (301/8) from the actuator piston shaft.

(2) Remove the bolt and nut that attach the cable rod end bearing to the valve idler arm at the turbine case cooling (TCC) air shutoff valve (HPT).

(3) Remove the lockwire from the jamnuts (301/6) at the cable rear support bracket (301/4) and loosen the jamnuts.

(4) Remove the bolts (301/12) and nuts (301/10) that attach the clamps (301/9) to the cable at the two clamping locations. Remove the clamps from the cable.

(5) Release the forward end of cable from the actuator piston shaft. Remove the cable from the engine.

NOTE: For additional information concerning detailed maintenance of this component see Turbine Case Cooling (TCC) Air Valve Control Cable Component Maintenance Manual, 75-24-13 (Controlex/Eanco).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-07

Task 72-00-53-050-001:

1. Remove Turbine Case Cooling (TCC) Air Valve (LPT)

   A. Equipment And Materials Required - None

   B. Procedure
      See Figure 301.

      (1) Remove the bolts and nuts that attach the lower support link to the flanges of the HPT and LPT (TCC) manifold collectors and move the support link inward toward the case. See Figure 301.

      (2) Remove the bolts and nuts that attach the lower flange of the valve to the lower support bracket.

      (3) Remove the bolts that attach the upper flange of the valve and upper support link to the upper support bracket.

      (4) Disconnect the rod end from the valve lever by removal of the bolt and nut.

      (5) Move the valve rearward and outward from between the support brackets.

         NOTE: For additional information concerning detailed maintenance of this component see Turbine Case Cooling Air Valve (LPT) Component Maintenance Manual, 75-24-11 (Parker Hannifin).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-08

Task 72-00-53-020-002:

1. Remove Low Pressure Turbine And Turbine Exhaust Case With Shaft

NOTE: See Figure 301 for part/assembly removal procedure.

NOTE: See 72-00-53, Removal-01 (Task 72-00-53-020-001) for procedure to remove low pressure turbine with turbine exhaust case previously removed.

A. Prerequisites

(1) Remove The Compressor Inlet Cone. Refer to 72-00-31, Removal-02 (Task 72-00-31-020-002-001).

(2) Remove The EEC Thermocouple And Airframe Cable (W6). Refer to 72-00-54, Removal-09 (Task 72-00-54-050-006-A00).

(3) Remove The External Parts. Refer to72-00-54, Removal-02 (Task 72-00-54-020-003).

(4) Remove The External Parts. Refer to 72-00-53, Removal-03 (Task 72-00-53-020-003).

B. Equipment And Materials Necessary

Standard Tools:

.190-32 Jackscrews, Eight Necessary Per Text

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)
PWA 25096	Stand (Optional To PWA 87330)
PWA 18872	Wrench, Hydraulic (Optional To PWA 33732)
PWA 26157	Pedestal, Engine Support (Optional To PWA 87359)
PWA 26318	Base, Extension
PWA 28657	Sling, Strongback, Handling
PWA 28668	Pump, Hydraulic (Use With Hydraulic Wrench)
PWA 28669	Cart (Optional) (Use With Hydraulic Wrench)
PWA 28814	Pump, Electric
PWA 28815	Cart, Storage (Optional To PWA 75046 For PWA 18872) (Use With Hydraulic Wrench)
PWA 29243	Bracket, Support (Two Necessary)
PWA 29389	Pump Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REMOVAL-08

Special Tools:

(CONTINUED)

PWA 29614	Wrench, Mechanical
PWA 33732	Wrench, Hydraulic
PWA 45418	Wrench, Mechanical
PWA 45419	Air Torque Multiplier (Optional To PWA 80651) (Use With Mechanical Wrench)
PWA 75046	Cart, Storage (Optional)
PWA 76154	Adapter (Two Necessary)
PWA 76270	Stand (Optional To PWA 87330)
PWA 80187	Wrench, Mechanical
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85062	Saddle, Support
PWA 85298	Puller, Jackscrew
PWA 85299	Adapter, Holding (Optional To PWA 102460 Adapter)
PWA 85300	Wrench, Torque (Use With Mechanical Wrench)
PWA 85306	Puller, Knocker
PWA 85307	Puller, Jackscrew
PWA 85452	Eye, Lifting
PWA 85456	Retainer, Front (Optional To PWA 85996)
PWA 85490	Drift, Assembly
PWA 85514	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85515	Adapter (Use With Hydraulic Wrench)
PWA 85562	Sleeve, Support (Used With PWA 25096 Or PWA 76270 Stand)
PWA 85769	Fixture (Install/Remove)
PWA 85785	Adapter, Piloting
PWA 85996	Retainer, Front (Optional To PWA 85456)
PWA 86210	Adapter, Piloting
PWA 86325	Fixture (Optional To PWA 86437)
PWA 86437	Fixture, Retainer (Optional To PWA 88222)
PWA 86604	Stand, Transport (Optional, To Store And Transport PWA 85769 Fixture)
PWA 87330	Stand
PWA 87347	Sleeve, Support (Used With PWA 87330 Stand)
PWA 87359	Pedestal, Engine Support
PWA 88204	Guide, Piloting
PWA 88222	Fixture, Retainer
PWA 102460	Adapter
PWA 102389	Post, Support (Two Necessary) (Optional To PWA 102393)
PWA 102393	Post, Adjustable Support (Two Necessary) (Optional To PWA 102389)
PWA 102460	Adapter (Use With Mechanical Wrench)
PWA 102727	Support
PWA 103636	Base, Support

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−08

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

C. Procedure

(1) Position and adjust PWA 102727 Support to engage and hold the fan inlet case at Flange "A" at the 6 o'clock location. If it is necessary because of the height of the engine in the pedestals, first install the Fan Case Support (PWA 102727) in a PWA 103636 Base Support. Attach the Fan Case Support (PWA 102727) to the Base Support (PWA 103636) with the three detail bolts and nuts.

NOTE: If necessary several Base Supports (PWA 103636) can be stacked together. They must be attached to each other with the three detail bolts and nuts.

(2) Install PWA 85062 Saddle to PWA 87359 Pedestal or PWA 26157 Pedestal. Secure saddle to pedestal with ball−lock pin.

(3) Position saddle and pedestal under diffuser case at 6 o'clock location just forward of Flange M. See Figure 302.

(4) Attach PWA 28657 Sling, two PWA 76154 Adapters and hoist to PWA 29243 Brackets on exhaust case at 3 and 9 o'clock.

(5) Adjust pedestal at diffuser case, 6 o'clock location, to support engine.

(6) Raise rear of engine and remove two pedestals from exhaust case location; then lower engine to level position, resting on pedestal at diffuser case. Do not remove sling.

(7) (Post SB PW4ENG 79−76) Remove No. 4 bearing (oil) pressure tube. See Figure 303.

NOTE: It is not necessary to remove the (Pre SB PW4ENG 79−76) No. 4 bearing (oil) pressure tube.

(a) Remove the No. 4 pressure tube (303/10) from the turbine exhaust case at the 4:30 o'clock position.

1 Remove two bolts (303/1) that attach the tube shield (303/16) and bracket (303/2) to the turbine exhaust case.

2 Remove the tube shield (303/16), bracket (303/2), thrust wire (303/18) and nut (303/17) from the outboard end of the pressure tube.

3 Remove the bolt (303/6) and nut (303/12) that attach the tube clamp (303/7) and tube to the bracket (303/8).

4 Cut the restraining straps (303/3) and remove the insulation slide clamp (303/13) and shield sets (303/9) and (303/4) from the tube.

5 Remove the tube nut from the adapter (303/14) and move the tube radially inward and remove the pressure tube from the case.

(b) Install a protective cover on the adapter (303/14).

(c) Secure bolts (303/5) and bracket (303/8) on the turbine exhaust case.

(8) Remove bolts (304/6) securing No. 4 bearing shield (304/5) to turbine exhaust case (rear inner flange) (304/1). Remove shield. Remove No. 4 bearing heat shield (304/4). See Figure 304.

(9) Remove No. 4 bearing cover (304/3).

(a) For No. 4 bearing cover (304/3) that has six small threaded holes (Pre SB PW4ENG 72−385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing (304/2).

(b) For cover that has eight jackscrew holes (Post SB PW4ENG 72−385), install and evenly tighten eight 0.190−32 Jackscrews to remove the cover. Discard the packing (304/2).

(10) (Pre SB PW4ENG 72−472) Remove the No. 4 bearing (oil) nozzle and No. 4 bearing packing transfer tube from boss in the exhaust case (No. 4 bearing compartment) at 1:30 o'clock position. See Figure 305.

(a) Remove bolts (305/8) and key washers (305/6) and (305/7) securing No. 4 bearing packing transfer tube (305/5) to No. 4 bearing nozzle (305/4). Remove tube.

(b) Remove bolts (305/1) and key washers (305/2) and (305/3) securing No. 4 bearing nozzle (305/4) to exhaust case. Remove nozzle.

(11) (Post SB PW4ENG 72−472) Remove the No. 4 bearing (oil) nozzle and front No. 4 bearing nozzle. See Figure 306.

(a) Remove the bolts and key washer (306/1) that attach the front No. 4 bearing nozzle to the No. 4 bearing support flange at the 12 o'clock position. Discard the key washer.

(b) Move the packing transfer tube (306/15) into the elbow of the No. 4 bearing damper supply tube (306/12). Remove the nozzle.

(c) Remove the packing transfer tube from the damper supply tube. Discard the two packings (306/14).

(d) Remove the bolts and key washers (306/16) and (306/17) that attach the No. 4 bearing damper supply tube (306/12) to the No. 4 bearing oil nozzle (306/11). Remove the tube.

(e) Remove the bolts and key washers (306/16) and (306/17) that attach the No. 4 bearing nozzle (306/11) to the exhaust case. Remove the nozzle.

(12) Remove the No. 4 bearing oil scavenge (inner) tube. See Figure 307.

(a) Remove Bolts (307/5 and 307/6) and key washers (307/4 and 307/7). Remove oil scavenge (inner) tube (307/8) from the turbine exhaust case.

(b) Remove and discard gasket (307/3).

(c) Cover hole in tube attachment pad on the case with a protective cover.

(13) Remove eight bolts and tabwashers (308/1) securing bearing retaining plate in rear of front compressor drive turbine shaft (308/2).

(14) Install PWA 86437 Fixture or PWA 86325 Fixture to attach the low pressure turbine shaft to the turbine exhaust case. See Figure 309 (Sheet 1).

NOTE: Use PWA 86325 Fixture with turbine exhaust cases that are (Pre SB PW4ENG 72−456). Use PWA 86437 Fixture with either (Pre or Post SB PW4ENG 72−456) turbine exhaust cases.

(a) Install inner slide (309/5) in ID of No. 4 bearing retaining plate and secure with eight detail screws (309/1).

(b) Install outer slide (309/4) over inner slide, locating slot in outer slide over key on inner slide.

(c) Rotate turbine shaft until scallops in flange of outer slide assembly align oil pressure and scavenge tubes protruding from exhaust case flange. Secure outer slide to exhaust case with eight detail bolts (309/2).

(d) Tighten eight cap screws (309/3).

(15) Install PWA 88222 Fixture or PWA 86437 Fixture to attach the low pressure turbine shaft to the turbine exhaust case. See Figure 309 (Sheet 2).

NOTE: Use PWA 88222 Fixture with (Pre or Post SB PW4ENG 72−456) turbine exhaust cases.

(a) Loosen the locknuts that hold the tube and guide assemblies together and install the fixture to the ID of the turbine exhaust case. The tube assembly detail will mate against the No. 4 bearing retaining plate and the guide assembly detail will mate against the rear inner flange of the exhaust case. Attach the fixture with the captured capscrews of both details.

NOTE: If necessary, turn the LPT rotor to align the holes in the end of the 7th stage disk or LPT shaft, as applicable, with the captured capscrews of the tube assembly detail.

(b) Tighten the capscrews of both details to lock the fixture in position.

(16) Remove key washer retaining ring (310/1) and retaining nut key washer (310/2) securing turbine shaft plug (310/3) at front of coupling. Using PWA 85306 Puller remove plug. Discard packing (310/4). See Figure 310.

(17) Remove retaining ring (310/5) and key washer (310/6) securing turbine shaft nut to LPT shaft.

(18) For operators that use the mechanical wrench, install the turbine shaft nut as follows:

(a) Install PWA 102460 Adapter or PWA 85299 Adapter into LPC/LPT coupling. See Figure 311.

1 Loosen wing nuts (311/1) and slide three clamps (311/2) radially inward.

2 Align keys in adapter with internal slots in coupling and install adapter in coupling. Index adapter as necessary to seat keys in slots in coupling. Slide three clamps radially outward to engage lugs of coupling. Tighten wing nuts to secure clamps.

(b) Install PWA 85300 Wrench, smaller splined end first, into center of PWA 102460 Adapter or PWA 85299 Adapter. Align spline of wrench with spline in ID of turbine shaft nut. Push wrench inward to seat on face of nut.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85300 Wrench. Align anti−torque pins in wrench with bushings in adapter and seat wrench against adapter face. See Table 301 for mechanical wrench options.

NOTE: Wrenches may be actuated using air torque multipliers to speed up removal of nut. Refer to Table 301.

PWA Mechanical Wrench	PWA Torque Multiplier
45418	45419
29614 or 80187	45419 or 80651

Table 301

CAUTION: PWA 80651 TORQUE MULTIPLIER MUST NOT BE USED WITH PWA 45418 WRENCH OR DAMAGE TO WRENCH MAY OCCUR.

(d) Actuate wrench to remove nut from shaft.

(e) Remove wrenches and adapter from coupling.

(f) Remove nut from turbine shaft.

(19) For operators that use the hydraulic wrench, install the turbine shaft nut as follows:

(a) Align boltholes and position PWA 85515 Adapter to rear face of PWA 33732 Wrench or PWA 18872 Wrench. Secure adapter with eight bolts (312/3). See Figure 312.

(b) Using hoist, position wrench and adapter assembly into front end of LPC/LPT coupling. Align teeth of adapter with slots in coupling and slide three clamps (312/1) outward to engage lugs of coupling. Tighten wing nuts (312/2) to secure adapter to coupling.

NOTE: PWA 28815 Cart or PWA 75046 Cart can be used to transport PWA 33732 Wrench or PWA 18872 Wrench and PWA 28814 Pump or PWA 29510 Pump.

(c) Install PWA 85514 Wrench, smaller splined end first, into center of PWA 33732 Wrench or PWA 18872 Wrench. Align spline of wrench with spline in turbine shaft nut (312/4). Push wrench inward to seat on face of nut.

(d) Connect PWA 28814 Electric Pump or PWA 29510 Hand Pump to wrench.

(e) Actuate wrench to remove nut from shaft.

(f) Remove wrenches and adapter from coupling.

(g) Remove nut from turbine shaft.

(20) Remove Flange N lockwire, bolts, nuts and brackets. Refer to 72−00−53, Removal−20 (Task 72−00−53−020−020).

(21) Install PWA 85769 Fixture (Install/Remove) into front end of low pressure turbine shaft. See Figure 313.

(a) Thread plug end of shaft (313/1) into end of turbine shaft until plug bottoms on shoulder of shaft.

(b) Guide body (313/4) and attached parts over previously installed shaft (313/1). Using dowel pin (313/2), retract locking pin. Rotate assembly to position locating plate behind lugs at front end of low pressure turbine coupling. Using dowel pin, release spring loaded locking pin to lock fixture to coupling.

(c) Guide hydraulic cylinder (313/6), threaded end first, over shaft and thread cylinder into body.

(d) Connect PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to hydraulic cylinder.

(22) Install jackscrews into threaded holes in Flange N.

(23) Apply hydraulic pressure to separate turbine shaft from LPC/LPT coupling and tightening jackscrews to break fit between turbine cases.

(24) Using dowel pin (313/2) retract locking pin into housing. Rotate body (313/4) to position lugs of locator plate between lugs of LPC/LPT coupling. Remove body from coupling. Unthread shaft (313/1) from turbine shaft.

(25) Remove jackscrews from turbine case Flange N.

(26) Thread the puck end of PWA 88204 Guide into the front end of the turbine shaft. See Figure 314.

NOTE: The guide can be separated into two parts if required.

(27) If the fan nut and the turbine shaft coupling are in place, slide the PWA 85785 Adapter, clamp end first, over the PWA 88204 Guide. Install the adapter in the ID of the fan nut. Use the detail clamps to attach the adapter to the coupling lugs. See Figure 314.

(28) Optional, if the fan nut and turbine shaft coupling are not in place, slide the PWA 85785 Adapter, clamp end first, over the PWA 87271 Guide or PWA 85784 Guide. Install the adapter in the 11.120 inch (282.448 mm) diameter of the fan hub. Use the detail clamps to attach the adapter to the flange.

(29) Optional, if the low pressure compressor is not in place, slide the PWA 86210 Adapter, clamp end first, over the PWA 88204 Guide. Use the detail clamps to attach the adapter to the No. 1 bearing support. See Figure 315.

(30) Move turbine assembly rearward approximately 12 inches (304.80 mm). If applicable, retain V−seal gasket located between cases until such time as the low pressure turbine is removed from engine.

(31) Align the center hole in PWA 85996 Front Retainer or PWA 85456 Front Retainer (316/3) with the dowel pin hole in the turbine case. Attach the retainer to the front flange of turbine case at 6 and 12 o'clock locations with four bolts (316/2) and nuts (316/1). Attach the clamps of the retainer to the front compressor drive turbine shaft with two bolts (316/4). See Figure 316.

(32) Use a second hoist and install a nylon sling around the turbine shaft. Take up the slack in the sling.

(33) Move the nylon sling as required and move the assembly rearward. Remove the turbine and exhaust case from the engine.

(34) Remove the V−seal gasket located between the outer flanges of the cases, if applicable.

(35) Remove the PWA 85785 Adapter or PWA 86210 Adapter as applicable.

(36) Remove the guide from the turbine shaft.

(37) Install PWA 85562 Support Sleeve into the shaft support cradles of PWA 25096 Stand or PWA 76270 Stand or PWA 87347 Support Sleeve into the shaft support cradles of PWA 87330 Stand. Position details−1 and −2 forward and details−3 and −5 rearward with details−2 and −3 down. Tighten the set screws to attach the sleeve details to the stand. See Figure 317.

(38) Install PWA 102389 Support Posts or PWA 102393 Adjustable Support Posts onto PWA 87330 Stand.

(39) Place turbine and turbine exhaust case in the stand so that the PWA 29243 Support Brackets align with the support posts. Tighten clamps around turbine shaft and slide chocks inward to contact rear flange of rear turbine case.

NOTE: Chocks are utilized as a safety device and do not support any portion of assembly.

(40) Remove hoist, sling, adapters and brackets from turbine exhaust case.

(41) Remove nylon sling and hoist from turbine shaft.

(42) Remove turbine shaft (classified) spacer using PWA 85298 Puller. See Figure 318.

(a) Loosen bolts and slide puller legs inward.

(b) Position puller over LPT shaft and slide legs outward, locating legs in puller groove of spacer. Tighten bolts to secure legs.

(c) Hold threaded bolt at center of puller and turn large hex head nut to remove spacer from end of turbine shaft.

(43) Lubricate the spline area at the front end of the turbine shaft with Engine Oil P03−001. If the shaft is not coated in the area forward or rearward of the spline, lubricate these areas also.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REMOVAL−20

Task 72−00−53−020−020:

1. Remove The Flange N Brackets And Hardware

   A. Equipment And Materials Necessary − None

   B. Procedure

      (1) Remove the Flange N brackets as follows. See Figure 301.

         (a) Tag and identify the flange N hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove the lockwire, nuts and bolts, which attach the brackets at Flange N.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−01

Task 72−00−53−420−001:

1. Install The Low Pressure Turbine With Shaft

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: This procedure is for installation of low pressure turbine with turbine exhaust case not installed.

NOTE: To Install The Low Pressure Turbine With Turbine Exhaust Case Installed, refer to 72−00−53, Installation−08 (Task 72−00−53−420−002).

A. Prerequisites

(1) See 72−00−53, Inspection/Check−01 (Task 72−00−53−990−001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)
PWA 18872	Wrench, Hydraulic (Optional To PWA 33732)
PWA 28657	Sling, Strongback, Handling
PWA 29389	Pump, Hydraulic
PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 29614	Wrench, Mechanical
PWA 33732	Wrench, Hydraulic
PWA 45418	Wrench, Mechanical
PWA 45419	Air Torque Multiplier (Optional To PWA 80651) (Use With Mechanical Wrench)
PWA 76154	Adapter
PWA 76270	Stand
PWA 80187	Wrench, Mechanical
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85291	Pins, Aligning (Two Required (Optional To PWA 101152)
PWA 85299	Adapter, Holding (Optional To PWA 102460)
PWA 85300	Wrench, Torque (Use With Mechanical Wrench)

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−01

Special Tools:

(CONTINUED)

PWA 85331	Retainer, Rear
PWA 85490	Drift, Assembly
PWA 85514	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85515	Adapter (Use With Hydraulic Wrench)
PWA 85769	Fixture (Install/Remove)
PWA 85785	Adapter
PWA 86210	Adapter, Piloting (Optional To PWA 85785. Used If The Low Compressor Is Not Installed)
PWA 86604	Stand, Transport (Optional, To Store And Transport PWA 85769 Fixture)
PWA 88204	Guide, Piloting
PWA 101152	Pins, Aligning (Two Necessary)
PWA 102460	Adapter (Use With Mechanical Wrench)
PWA 102727	Support
PWA 103636	Base, Support

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P06−002	Petrolatum, White (PMC 9609)
P06−021	Compound, Antigalling (PWA 550)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72−32−00/2/30

C. Procedure

(1) Install turbine shaft spacer into front end of front compressor drive turbine shaft using PWA 85490 Drift. See Table 401 and Figure 402.

Class	Thickness
1	0.550 − 0.555 Inch (13.970 − 14.097 mm)
2	0.555 − 0.560 Inch (14.097 − 14.224 mm)
3	0.560 − 0.565 Inch (14.224 − 14.351 mm)
4	0.565 − 0.570 Inch (14.351 − 14.478 mm)
5	0.570 − 0.575 Inch (14.478 − 14.605 mm)
6	0.575 − 0.580 Inch (14.605 − 14.732 mm)
7	0.580 − 0.585 Inch (14.732 − 14.859 mm)
8	0.585 − 0.590 Inch (14.859 − 14.986 mm)
9	0.590 − 0.595 Inch (14.986 − 15.113 mm)
10	0.595 − 0.600 Inch (15.113 − 15.240 mm)
11	0.600 − 0.605 Inch (15.240 − 15.367 mm)
12	0.605 − 0.610 Inch (15.367 − 15.494 mm)
13	0.610 − 0.615 Inch (15.494 − 15.621 mm)
14	0.615 − 0.620 Inch (15.621 − 15.748 mm)
15	0.620 − 0.625 Inch (15.748 − 15.875 mm)
16	0.625 − 0.630 Inch (15.875 − 16.002 mm)
17	0.630 − 0.635 Inch (16.002 − 16.129 mm)
18	0.635 − 0.640 Inch (16.129 − 16.256 mm)
19	0.640 − 0.645 Inch (16.256 − 16.383 mm)
20	0.645 − 0.650 Inch (16.383 − 16.510 mm)
21	0.650 − 0.655 Inch (16.510 − 16.637 mm)
22	0.655 − 0.660 Inch (16.637 − 16.764 mm)
23	0.660 − 0.665 Inch (16.764 − 16.891 mm)
24	0.665 − 0.670 Inch (16.891 − 17.018 mm)
25	0.670 − 0.675 Inch (17.018 − 17.145 mm)
26	0.675 − 0.680 Inch (17.145 − 17.272 mm)
27	0.680 − 0.685 Inch (17.272 − 17.399 mm)

Spacer Classification Data
Table 401

(2) Position and adjust PWA 102727 Fan Case Support to engage and hold the fan inlet case at Flange "A" at the 6 o'clock location. If it is necessary because of the height of the engine in the pedestals, first install the Fan Case Support (PWA 102727) in a PWA 103636 Base Support. Attach the Fan Case Support (PWA 102727) to the Base Support (PWA 103636) with the three detail bolts and nuts.

NOTE: If necessary several Base Supports (PWA 103636) can be stacked together. They must be attached to each other with the three detail bolts and nuts.

(3) Using hoist, attach PWA 28657 Sling with two PWA 76154 Adapters to trunnion spools of PWA 85331 Retainer at rear of low pressure turbine. See Figure 403.

(4) Attach second hoist and nylon sling to front compressor drive turbine shaft.

(5) If the turbine shaft spline is not clean, or if it has a heavy type of rust preventive, clean the spline by SPOP 209 (wipe method). See Standard Practices Manual, PN 585005.

(6) Lubricate two interface diameters and the spline area at front end of front compressor drive turbine shaft with Engine Oil P03−001. If the shaft is uncoated in the area forward and rearward of the spline, lubricate these areas also. See Figure 404.

(7) Loosen hand knobs and open clamps securing turbine shaft to PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

NOTE: After removal of assembly from stand, PWA 85562 Sleeve or PWA 87347 Sleeve details may be removed from front and rear supports of PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

(8) Using hoists, lift low pressure turbine from stand and align shaft with high pressure compressor rear hub.

CAUTION: DO NOT INSTALL SEAL IN HIGH TURBINE CASES WHICH DO NOT HAVE A SEAL GROOVE IN THE REAR FLANGE. AFFECTED CASES ARE PN 50L170 AND 50L292.

(9) Install seal to rear flange of high pressure turbine case. Seal may be temporarily secured to flange with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(10) If the fan nut and the turbine shaft coupling are in place, install PWA 85785 Adapter in the ID of the fan nut. Use the detail clamps to attach the adapter to the coupling lugs. See Figure 405.

(11) Optional, if the fan nut and turbine shaft coupling are not in place, install PWA 85785 Adapter in the 11.120 inch (282.448 mm) diameter of the fan hub. Use the detail clamps to attach the adapter to the underside of the hub flange. See Figure 405.

(12) Optional, if the low pressure compressor is not in place, install PWA 86210 Adapter to the ID of the No. 1 bearing support. Use the detail clamps to attach the adapter to the support. See Figure 406.

(13) Thread the puck end of PWA 88204 Guide into the front end of the turbine shaft. See Figure 407.

NOTE: The guide can be separated into two parts if required.

(14) Hand guide the assembly from the rear and move the assembly forward. Move the nylon sling as required and insert the guide through the ID of the PWA 85785 Adapter or PWA 86210 Adapter.

(15) Move the assembly forward until the turbine shaft engages the ID spline of the turbine shaft coupling at the front end of the engine.

(16) Remove nylon sling and hoist from turbine shaft. Move assembly forward until approximately 12 inches (304.820 mm) gap exists between turbine front and rear cases.

(17) Remove the retainer (408/3) from the front flange of the turbine rear case and the front compressor drive turbine shaft. See Figure 408.

  (a) Remove two bolts (408/4) securing upper and lower details of retainer.

  (b) Remove bolts (408/2) and nuts (408/1) securing upper and lower retainer details to low pressure turbine case.

(18) Move the turbine forward and install several work bolts and nuts to boltholes in Flange N.

(19) Remove the PWA 85785 Adapter or PWA 86210 Adapter as applicable.

(20) Remove the guide from the turbine shaft.

(21) Install two PWA 85291 Aligning Pins or PWA 101152 Aligning Pins.

  (a) Locate two threaded jackscrew holes 180 degrees apart in front flange of turbine rear case.

(b) Insert pins through boltholes between jackscrew holes from rear side of front flange.

(c) Thread detail bolts into jackscrew holes to secure pins.

(22) Install PWA 85769 Fixture (Install/Remove) into front end of low pressure turbine shaft. See Figure 409.

(a) Thread plug end of shaft (409/1) into end of turbine shaft until plug bottoms on shoulder of shaft.

(b) Guide body (409/4) and attached parts over previously installed shaft (409/1). Using dowel pin (409/2), retract locking pin. Rotate assembly to position locating plate behind lugs at front end of low pressure turbine coupling. Using dowel pin, release spring loaded locking pin to lock fixture to coupling.

(c) Install puck (409/5) onto shaft, and engage small diameter of puck into body (409/4).

(d) Guide hydraulic cylinder (409/6), threaded end first, onto shaft. Secure cylinder with nut (409/7).

CAUTION: LOOSEN HAND KNOBS OF PWA 85331 RETAINER WHEN FRONT FLANGE OF REAR CASE MEETS REAR FLANGE OF TURBINE FRONT CASE TO AVOID DAMAGE TO NO. 1 BEARING IF TURBINE SHAFT COUPLING SPACER IS BELOW REQUIRED DIMENSIONS.

(23) Tighten workbolts in Flange N and apply hydraulic pressure to pusher−puller ram and seat front compressor drive turbine shaft in LPC/LPT coupling. Front flange of turbine rear case should now butt rear flange of turbine front case.

CAUTION: TO ENSURE PROPER SEATING OF CLASSIFIED SPACER, HYDRAULIC PRESSURE MUST BE APPLIED TO PUSHER−PULLER, WHEN PERFORMING LOW PRESSURE TURBINE POSITIONING CHECK.

(24) (Reference 828 or 850) Check running position of low pressure turbine rotor assembly while pressure

is applied to PWA 85293 Pusher−Puller. See Figure 410(Sheet 1).

NOTE: If the coupling is not installed, then install the classified spacer for the low turbine running position during the LPC/LPT coupling 72−00−32, Installation−01 (Task 72−00−32−420−001).

NOTE: Running position check is required whenever low pressure turbine is installed, (except when the LPC/LPT coupling is not in place) regardless of whether same or different unit (from another engine) is installed. Measurement should be an average of at least two measurements taken at equally spaced locations.

(a) Using standard depth micrometer, measure distance from vertical fixture plates to 6th stage LPT disk at four inspection slot locations.

(b) Subtract measured dimension from basic tool dimension 2.000 stamped on plate to determine running position.

(c) (Reference 850) For engines (Post SB PW4ENG 72−256), with the revised LPT airfoils, 5th stage turbine hub, and the new 5th stage airseal, the low pressure turbine axial running position must be within the limits specified for (Reference 850). See Figure 410 (Sheet 2).

(d) (Reference 828) For engines (Pre SB PW4ENG 72−256), without the revised LPT airfoils, the new 5th stage turbine hub, and the new 5th stage airseal, the low pressure turbine axial running position must be within the limits specified for (Reference 828). See Figure 410 (Sheet 2).

(e) If necessary, remove front compressor drive turbine and use a new classified spacer.

1 Make record of axial running position dimension. This dimension will be used to find new spacer class.

2 Remove The Front Compressor Drive Turbine. See 72−00−53, Removal−01 (Task 72−00−53−020−001).

3 Remove classified spacer from end of turbine shaft. Measure and make a record of spacer thickness.

4 Find the new classified spacer necessary to correctly set the running position of the low pressure turbine. Spacer class is found using Table 401.

NOTE: Class of turbine shaft spacer can be changed by 72−53−81, Repair−01. See PW4000 Series CIR, PN 51A357.

5 Install new classified spacer onto end of turbine shaft.

6 Install front compressor drive turbine, with new classified spacer, again.

7 Check axial running position dimension again.

(25) Release hydraulic pressure. Disconnect hydraulic pump.

(26) Remove PWA 85769 Puller from engine.

(a) Using dowel pin (409/2), retract locking pin into housing. Rotate body (409/4) to position lugs of locator plate between lugs of LPC/LPT coupling. Remove body from coupling.

(b) Unthread and remove shaft (409/1) from turbine shaft.

(27) Remove two PWA 85291 Guide Pins or PWA 101152 Guide Pins from Flange N.

(28) Install Flange N as follows. Refer to 72−00−53, Installation−20 (Task 72−00−53−420−020).

(29) Assemble LPT flat washer (411/4) into ID of LPC/LPT coupling. See Figure 411.

NOTE: If LPC/LPT coupling is removed, omit installation of turbine shaft nut and associated hardware specified in following steps. These parts are to be installed with coupling per 72−00−32, Installation−01 (Task 72−00−32−420−001).

(30) Apply Antigalling Compound P06−021, to turbine shaft nut areas specified in Figure 412. Cure compound for five minutes minimum prior to assembly.

(31) Thread turbine shaft nut (411/3) into front compressor drive turbine shaft.

(32) For operators that use the mechanical wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 102460 Adapter or PWA 85299 Adapter into LPC/LPT coupling. See Figure 413.

1 Loosen wing nuts (413/1) and slide three clamps (413/2) radially inward.

2 Align keys in adapter with internal slots in coupling and install adapter in coupling. Index adapter as necessary to seat keys in slots in coupling. Slide three clamps radially outward to engage lugs of coupling. Tighten wing nuts to secure clamps.

(b) Install PWA 85300 Wrench, smaller splined end first, into center of PWA 102460 Adapter or PWA 85299 Adapter. Align spline of wrench with spline in ID of turbine shaft nut. Push wrench inward to seat on face of nut.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85300 Wrench. Align antitorque pins in wrench with bushings in adapter and seat wrench against adapter face. See Table 402 for mechanical wrench options.

PWA Mechanical Wrench	PWA Torque Multiplier
45418	45419
29614 or 80187	45419 or 80651

Mechanical Wrench Options
Table 402

(33) For operators that use the hydraulic wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Align boltholes and position PWA 85515 Adapter to rear face of PWA 33732 or PWA 18872 Wrench. Secure adapter with eight bolts (414/3). See Figure 414.

(b) Using hoist, position wrench and adapter assembly into front end of LPC/LPT coupling. Align teeth of adapter with slots in coupling and slide three clamps (414/1) outward to engage lugs of coupling. Tighten wing nuts (414/2) to secure adapter to coupling.

NOTE: PWA 28815 or PWA 75046 Cart may be used to transport Wrench (PWA 33732) or (PWA 18872) and PWA 28814 or PWA 29510 Pump.

(c) Install PWA 85514 Wrench, smaller splined end first, into center of Wrench (PWA 33732) or (PWA 18872). Align spline of wrench with spline in turbine shaft nut (414/4). Push wrench inward to seat on face of nut.

(d) Connect PWA 28814 Electric Pump or PWA 29510 Hand Pump to wrench.

CAUTION: PWA 80651 TORQUE MULTIPLIER MUST NOT BE USED WITH PWA 45418 WRENCH OR DAMAGE TO WRENCH MAY OCCUR.

(34) (Reference 971) Torque turbine shaft nut.

NOTE: Mechanical wrenches may be actuated using air torque multipliers per Table 402.

(a) Tighten nut to 5000 − 7000 lb−in. (564.924 − 790.894 N.m), turn nut through an angle of 43 − 47 degrees. Loosen nut to zero.

(b) Tighten nut to 4000 − 6000 lb−in. (451.939 − 677.909 N.m).

(c) Establish common reference points between nut and its mating part.

(d) Turn nut through an angle of 43 − 47 degrees.

(e) Loosen nut to zero and repeat step (b).

(f) If nut reference point is in line with mating part reference point or beyond it within two degrees maximum, apply final angle of turn per step (d).

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order, until reference points are within limits. Then perform step (f).

(35) Remove tooling from coupling.

(36) Install key washer (415/6) and retaining ring (415/5) to secure turbine shaft nut. Make sure retaining ring is fully inserted in the retaining nut groove, all around, and ring end gap is 0.010 inch (0.254 mm) minimum. Remove guide from hub.

(37) Install new packing (415/4) lubricated with Petrolatum White P06−002, to turbine shaft plug (415/3). Install plug to coupling ID and secure with key washer (415/2) and retaining ring (415/1). See Figure 415.

D. Postrequisites

(1) Install/Connect The External Parts To Complete Installation Of The Low Pressure Turbine (LPT). Refer to 72−00−53, Installation−03 (Task 72−00−53−420−003).

(2) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(3) Install The Turbine Exhaust Case. Refer to 72−00−54, Installation−01 (Task 72−00−54−420−001).

(4) Test the engine per the Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−02

Task 72−00−53−420−001−002:

1. Install The Low Pressure Turbine With Shaft (Hydraulic Wrench) − Deleted

A. Procedure

(1) This procedure is relocated to 72−00−53, Installation−01 (Task 72−00−53−420−001).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-03

Task 72-00-53-420-003:

1. Install External Plumbing After Low Pressure Turbine Installation

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-24-00/2/5
Gasket	1	75-24-00/3/25
Gasket	1	75-24-00/3/125
Seal Plate	1	75-24-00/2/1
Seal Plate	1	75-24-00/3/20
Seal Plate	1	75-24-00/3/120

B. Procedure
See Figures 401, 402, 403 and 404.

(1) Install HPT manifold (collector) assembly as follows.

(a) Install bolt, threads lubricated with Engine Oil P03-001, spacer and nut to Flange M bracket at approximately 3 o'clock position. Torque bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(b) Remove protective closures and install manifold (collector) with clamp, screw, threads lubricated with Engine Oil P03-001, and nut to spacer. Torque screw to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install turbine case cooling (TCC) HPT manifolds (AC21) through (AC28) (less lower front manifold) as follows.

(a) Install support brackets, angled rearward and on rear side of Flange N brackets (five locations) with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Install support brackets, angled forward, and on front side of Flange M brackets (three locations) with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Remove protective closures and rotate upper and lower rear manifolds to engage manifold (collector). Secure to manifold (collector) with bolts, threads lubricated with Engine Oil P03−001, handtight only. Secure manifolds to support brackets with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(d) Remove protective closures and install upper and lower, center two, manifolds to engage manifold collector. Secure to manifold (collector) with bolts, threads lubricated with Engine Oil P03−001, handtight only. Secure manifold supports at each end to brackets (six locations) with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(e) Remove protective closures and install upper front manifold to engage manifold (collector). Secure to manifold (collector) with bolt, threads lubricated with Engine Oil P03−001, handtight only. Secure manifold to support brackets (three locations) with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(f) Torque all bolts securing all manifolds to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(3) Install turbine vane cooling air duct (lower left) (AP03) as follows.

(a) Remove protective closures.

(b) Install a new gasket in place on the HPC case boss with Paraffin Wax P05−059 at approximately the 9 o'clock position.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install a new metering orifice seal plate, convex side outward, in place to the pad at approximately the 7 o'clock position on the HPT case with Paraffin Wax P05−059 (Engines with SB PW4ENG 72−315 and without SB PW4ENG 75−57).

(d) FOR THESE MODELS: 4152, 4156A, 4158
Install a new gasket in place on the HPT pad with Paraffin Wax P05−059 at approximately the 7 o'clock position (Engines without SB PW4ENG 72−315 and with SB PW4ENG 75−57).

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install a metering orifice seal plate in place to the pad at approximately the 7 o'clock position on the HPT case with Paraffin Wax P05−059.

(f) Position the cooling air duct to the above pads and attach the rear of the duct with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Align boltholes of bracket (attached to the No. 4 bearing oil pressure tube) with boltholes in the front flange of the duct. Attach the front flange and bracket to the HPC boss with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(h) FOR THESE MODELS: 4152, 4156A, 4158
Attach the front flange of the cooling air duct to the HPC case with two longer bolts and washers at the two uppermost locations and four shorter bolts at the remaining bolt holes (Engines without SB PW4ENG 79−54), threads lubricated with Engine Oil P03−001, handtight only.

(i) FOR THESE MODELS: 4152, 4156A, 4158
Attach the front flange of the cooling air duct to the HPC case with bolts, threads lubricated with Engine Oil P03−001 (Engines with SB PW4ENG 79−54).

(j) Position clamp over duct at bracket on diffuser case boss and secure to bracket with bolts, threads lubricated with Engine Oil P03−001, an nuts. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(k) Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(l) Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(m) Torque the clamp bolt that attaches the No. 4 bearing oil pressure tube to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(n) Install a bolt, threads lubricated with Engine Oil P03−001, and a nut to the clamp that attaches the No. 3 bearing pressure manifold (LP18) to the bracket on the front flange of the cooling air tube. Adjust the spray shield on the inboard side of the manifold and torque the bolt clamp to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(o) For engines equipped, install gasket to borescope plug groove. Install plug to rear elbow and engage end of plug into inner hole to seat. Install three bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m), then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(4) Install turbine vane cooling air duct (upper left) (AP04) as follows.

(a) Remove protective closures.

(b) Secure a new gasket in place on flange of turbine cooling air valve with Paraffin Wax P05−059.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install a new metering orifice seal plate (Engines without SB PW4ENG 72−315 or SB PW4ENG 75−57) or a gasket (Engines with SB PW4ENG 72−315 or SB PW4ENG 75−57) in place on the HPT pad with Paraffin Wax P05−059 at approximately the 9 o'clock position.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install a new gasket in place on the HPT pad with Paraffin Wax P05−059 at approximately the 9 o'clock position.

(e) Position cooling air duct to HPT boss and to rear of cooling air valve and secure with bolts, threads lubricated with Engine Oil P03−001, larger bolts at rear flange handtight only.

(f) Position clamp to cooling air duct at bracket on diffuser case and secure with bolts and nuts lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque bolts at forward flange to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to same limit without loosening until torque is maintained.

(h) Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at the rear flange of the duct.

(5) FOR THESE MODELS: 4152, 4156A, 4158
Install (upper right) turbine cooling tube assembly (AP01) as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove protective closures.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Secure new gasket in place to pad at approximately 2 o'clock position on HPC rear case with Paraffin Wax P05−059.

(c) FOR THESE MODELS: 4152, 4156A, 4158
(Pre SB PW4ENG 72−315), Secure new gasket in place to pad at approximately 1 o'clock position on HPT case with Paraffin Wax P05−059.

(d) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 72−315), Install a new metering orifice seal plate, convex side outward, in place to the pad at approximately at the 1 o'clock position on the HPT case with Paraffin Wax P05−059.

(e) FOR THESE MODELS: 4152, 4156A, 4158
Install front flange of tube with smaller bolts, threads lubricated with Engine Oil P03−001, and bracket to HPC boss handtight only.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Install rear flange of tube with larger bolts, threads lubricated with Engine Oil P03−001, to HPT boss handtight only.

(g) FOR THESE MODELS: 4152, 4156A, 4158
Install clamp and bolts, threads lubricated with Engine Oil P03−001, to diffuser case bracket. Torque clamp bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(h) FOR THESE MODELS: 4152, 4156A, 4158
Torque bolts at front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(i) FOR THESE MODELS: 4152, 4156A, 4158
Torque bolts at rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m) then retorque to same limit without loosening until torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(6) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the (upper right) turbine vane cooling air duct (AP01) as follows.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the protection covers.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install a new gasket to the front flange of the cooling air duct. Attach the gasket to the duct flange with Paraffin Wax P05−059.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install a new metering orifice seal plate, convex side outward, to the HPT pad located approximately at the 1 o'clock position. Attach the plate with Paraffin Wax P05−059.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the cooling air duct to the HPT pad and to valve flange. Attach the duct with bolts, threads lubricated with Engine Oil P03−001, with the larger bolts at the rear flange. Tighten the bolts by hand.

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install a clamp over the cooling air duct at the support on the diffuser case at approximately the 2 o'clock position. Attach the clamp to the support with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque the bolts at the front flange to 85 − 95 lb−in. (9.604 − 10.734 N.m). Continue to torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m) until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque the bolts at the rear flange to 180 − 200 lb−in. (20.337 − 22.597 N.m). Continue to torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m) until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

(7) Install turbine case cooling (TCC) air shutoff valves as follows.

NOTE: Be sure and do not use the TCC blank−off plate, PN 53T473, between the upper support bracket and the TCC duct.

NOTE: Be sure and do not use the TCC metering−plate, PN 53T542, for engines with the SCN−8 EEC (Post SB PW4ENG 73−53). For engines prior to the SCN−8 EEC (Pre SB PW4ENG 73−53), use the metering−plate, PN 53T542, between the upper support bracket and the TCC duct. See SB PW4ENG 75−56 if more information is needed.

(a) Remove protective closures and position lower link under flange of manifold (collector) and secure to LPT case bracket with bolt, threads lubricated with Engine Oil P03−001, and nut handtight only.

(b) Position lower support bracket over collector and secure to Flange N bracket with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(c) Install HPT case cooling air shutoff valve (flow arrows pointing down) on lower support bracket and secure with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(d) Position upper link under top flange of valve and secure to LPT case bracket with bolt, threads lubricated with Engine Oil P03−001, and nut handtight only.

(e) Position upper support bracket over top flange of valve and secure to Flange N bracket with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(f) Secure turbine case cooling duct with bolts, threads lubricated with Engine Oil P03−001, to upper support link, valve flange and upper support bracket handtight only.

(g) Slide LPT case cooling air shutoff valve (flow arrows pointing down) between upper and lower support brackets and secure to upper support bracket, link and duct with bolts threads lubricated with Engine Oil P03−001, handtight only. Do not install bolts through bottom flange of LPT valve as yet.

(h) Secure turbine pull control cable bracket to upper support bracket with screw, threads lubricated with Engine Oil P03−001, handtight only.

(i) Install struts to Flange M brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(j) Install braces to Flange N brackets with washers, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(k) Align struts and braces with turbine pull control cable bracket and install bolt, threads lubricated with Engine Oil P03−001, spacers and nut handtight only.

(l) Torque screw and all bolts securing upper and lower links, upper and lower support brackets, valve flanges, duct, struts and braces to 85 − 95 lb−in. (9.604 − 10.734 n.m).

C. Postrequisites

(1) Install turbine case cooling (TCC) air valve control cable per 72−00−53, Installation−06.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-04

Task 72-00-53-450-002:

1. Install Turbine Case Cooling Manifold (Collector)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure

See Figures 401 and 402.

(1) Remove protective closures.

(2) Position turbine case cooling manifold (collector) to support bracket and LPT cooling valve using bolts, threads lubricated with Engine Oil (P03-001), and nuts handtight only.

(3) Install clamps to front manifold (collector) mount and secure to bracket on Flange N with bolts, threads lubricated with Engine Oil (P03-001), handtight only.

(4) Install clamps to rear manifold (collector) mounts and secure to brackets on Flange P with bolts, threads lubricated with Engine Oil (P03-001), and nuts handtight only.

(5) Slide lower cooling air manifolds upward and engage with manifold (collector) tubes. Secure manifolds with bolts, threads lubricated with Engine Oil (P03-001), handtight only.

(6) Slide upper cooling air manifolds downward engaging cooling manifolds with tubes on manifold (collector). Secure manifolds with bolts, threads lubricated with Engine Oil (P03-001), handtight only.

(7) FOR THESE MODELS: 4152, 4156A, 4158
Install cover assemblies on the upper and lower rear tubes (No. 7) of the manifold (collector). Attach the covers to the tubes with bolts, threads lubricated with Engine Oil (P03-001) and tighten by hand (Engines with PW4ENG 75-53).

(8) Install bolts, threads lubricated with Engine Oil (P03−001), and nuts to secure cooling air manifold brackets to brackets on Flange N and bracket on LPT case handtight only.

(9) Install the clamps to the rear mounts of the cooling air manifold brackets. Attach the manifolds to the brackets on Flange P with bolts, threads lubricated with Engine Oil (P03−001) and nuts tightened by hand.

(10) Torque all bolts, previously installed, as follows:

(a) Torque bolts securing manifold (collector) to support bracket and valve flange to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(b) Torque bolts securing front manifold (collector) mount to Flange N bracket to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque bolts securing manifold (collector) rear mount clamps to Flange P brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque all upper and lower cooling air manifolds retaining bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque all bolts on forward mount brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque all bolts securing clamps on rear mounts to brackets on Flange P to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-53-450-003:

1. Install Turbine Case Cooling (TCC) LPT Manifolds

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-021	Compound, Antigalling (PWA 550)
R	P06-054	Paste, Antiseize (PWA 36246)

B. Procedure

See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) Remove protective closures.

(2) Position upper half of LPT cooling air manifolds (AC08) through (AC14) to LPT case and rotate around case engaging manifold ends with detail tubes of manifold (collector).

(3) Install bolts, threads lubricated with Engine Oil P03-001, to manifold ends to secure upper cooling manifolds to manifold (collector) handtight only.

(4) Position lower half of LPT cooling air manifolds (AC01) through (AC07) to LPT case and rotate around case engaging manifold ends with detail tubes of manifold (collector).

(5) Install bolts, threads lubricated with Engine Oil P03-001, to manifold ends to secure lower cooling manifolds to collector handtight only.

(6) FOR THESE MODELS: 4152, 4156A, 4158
(Post SB PW4ENG 75−53 and Pre SB PW4ENG 79−76 only)
Install cover assemblies on the upper and lower rear tubes (No. 7) of the manifold (collector). Attach the covers to the tubes with bolts, threads lubricated with Engine Oil P03−001 and tighten by hand.

(7) FOR THESE MODELS: 4152, 4156A, 4158
Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to Flange P brackets with bolts, threads lubricated with Engine Oil P03−001, spacers and nuts tightened by hand (Pre SB PW4ENG 75−50).

(8) FOR THESE MODELS: 4152, 4156A, 4158
Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to Flange P brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts tightened by hand (Post SB PW4ENG 75−50).

(9) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to Flange P brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts tightened by hand.

(10) Install bolts, threads lubricated with Engine Oil P03−001, and nuts to secure forward end of cooling air manifold brackets to brackets on Flange N handtight only.

NOTE: When installing bolt and nut at approximately 8 o'clock position; secure LPT tube clamp with bolt and nut.

(11) Torque bolts securing cooling air manifolds as follows:

(a) Torque bolts securing rear mount clamps to Flange P brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Torque all bolts securing forward mount brackets to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque all upper and lower cooling air manifolds to collector retaining bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: USE OF LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS COULD RESULT IN CONTAMINATION OF EEC.

(12) (Post SB PW4ENG 79-76) Install brackets on the turbine case cooling brackets. Torque the bolts to 24 - 32 lb-in. (2.712 - 3.616 N.m).

(13) (Pre SB PW4ENG 79-76) Install (rear) EEC PT4.95 tube assembly (AS02) as follows.

(a) Remove protective closures from the tube fittings.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Secure the tube nut to a tee at approximately the 6 o'clock position and rearward of Flange P (Pre SB PW4ENG 72-134).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Secure the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P (Post SB PW4ENG 72-134).

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Attach the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P.

(e) Secure the tube nut to the tube coupling at approximately the 8 o'clock position and rearward of Flange N.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of a bolt with Engine Oil P03-001. Secure the tube with a clamp, bolt, and nut to the bracket on Flange P at approximately the 6:30 o'clock position. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m) (Pre SB PW4ENG 72-134).

(g) Torque tube nuts to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(14) (Pre SB PW4ENG 79-76) Install (rear) No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Install oil vent tube to adapter, threads
R lubricated with Antiseize Paste P06−054, on
exhaust case at approximately 7 o'clock position
and secure to adapter, threads lubricated with
R Antiseize Paste P06−054, on forward end of tube to
front oil vent tube just rearward of Flange M,
R handtight only. Wipe off unwanted paste.

(b) Install clamp to tube and secure to bracket on Flange N with bolt, threads lubricated with Engine Oil P03−001, and nut handtight only.

(c) Lubricate the threads of the bolts with Engine Oil P03−001, and install clamps to the tube and adjacent PT4.95 tube assembly. Secure the clamps on the tubes to brackets on Flange P with the bolts and nuts, and tighten by hand.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Lubricate the threads of the bolt with Engine Oil P03−001. Secure tube to the adjacent PT4.95 tube assembly with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P (Post SB PW4ENG 72−134).

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Lubricate the threads of the bolt with Engine Oil P03−001. Attach the tube to the adjacent PT4.95 tube assembly with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P.

(f) Install clamp to tube and secure to adjacent tube between Flange N and Flange P with bolt, threads lubricated with Engine Oil P03−001, and nut handtight only.

(g) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Torque tube nuts (both ends) to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(15) (Post SB PW4ENG 79−76) Install the (rear) EEC PT4.95 tube assembly (AS02) and the (rear) No. 3 bearing oil vent tube assembly (LD02) as follows. See Figure 405.

(a) Attach the (LD02) tube to the (LD01) and the turbine exhaust case, handtight only. See Figure 405 (Sheet 1).

(b) Attach the (AS02) tube to the (AS03) and (AS27) tubes, handtight only. See Figure 405 (Sheet 1).

(c) Install bolt to attach the (AS02) tube to the bracket handtight only. See Figure 405 (Sheet 2), View G.

(d) Install the clamp on the (LD02) tube and the clamp on the (LP48) tube and secure with nut and bolt, handtight only. See Figure 405 (Sheet 2), View L.

(e) Install the clamp on the (AS02) and (LD02) tubes and secure with a bolt, handtight only. See Figure 405 (Sheet 3), View H.

(f) Install clamp on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View I.

(g) Install clamps on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View J.

(h) Install clamp on (AS27) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View K.

(i) Torque the (AS02) tube to the (AS03) tube and the (AS27) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(j) Torque the (LD02) tube to the internal tube and the (LD01) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(k) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(16) (Pre SB PW4ENG 79−75) Install (rear) No. 4 bearing oil scavenge tube assembly (LR06) as follows.

(a) Install rear scavenge tube, elbow threads
R lubricated with Antiseize Paste P06-054, to tube
nut on internal tube at approximately 10 o'clock
position on exhaust case and to adapter, threads
R lubricated with Antiseize Paste P06-054, on
front scavenge tube at Flange M at approximately
R 7 o'clock position handtight only. Wipe off
R unwanted paste.

(b) Install clamps to tube and secure to brackets on Flanges N and P with bolts, threads lubricated with Engine Oil P03-001, and nuts handtight only.

(c) Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque tube nut at exhaust case connection to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(e) Torque tube nut at Flange N connection to 475 - 525 lb-in. (53.668 - 59.317 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) (Reference 2151) Position shield to inboard side of Flange M connection and secure forward end with clamp. Torque clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(g) Install clamp to rear of shield over tube and secure to Flange M bracket with bolt, threads lubricated with Engine Oil P03-001, and nut. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(17) (Post SB PW4ENG 79-75 and Pre SB PW4ENG 79-76 only) Install (rear) No. 4 bearing scavenge tube assembly (LR06) as follows.

(a) Install rear scavenge tube, threads lubricated
R with Antiseize Paste P06-054, to exhaust case
internal tube nut at approximately 10 o'clock
position, and to the tube (LR05) coupling forward
of Flange M at approximately 7 o'clock position,
R handtight only. Wipe off unwanted paste.

(b) Install loop clamp bracket on Flange M bracket at approximately 7 o'clock with bolts lubricated with Engine Oil P03−001, handtight only. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Secure tube to loop clamp bracket on Flange M bracket with one clamp and bolt, lubricated with Engine Oil P03−001, handtight only. Torque clamp bolt to 27 − 30 lb−in. (4.067 − 4.519 N.m).

(d) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flange N and P brackets. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nut at exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Position tube shield to inboard side of Flange M connection and secure forward end of shield with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(18) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows.

(a) Attach the (LR21) tube to the (LR05) tube handtight only. See Figure 405 (Sheet 4), View DE.

(b) Install clamps and secure with nuts and bolts, handtight only. See Figure 405 (Sheet 5), Views O and Q and (Sheet 6), Views F and R.

(c) Attach the (LR22) tube to the (LR21) tube and the port for the internal tube on the turbine exhaust case, handtight only. Lubricate the threads that are on the internal tube with Engine Oil P03−001. See Figure 405 (Sheet 7), Views E and AP.

(d) Install clamps on the (LR22) tube and secure with bolts, handtight only. See Figure 405 (Sheet 8), Views A, B, C and D.

(e) Torque the (LR21) tube to the (LR05) tube to 475 − 525 lb−in. (56.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque the (LR21) tube to the (LR22) tube to 475 − 525 lb−in. (56.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Torque the internal tube nut to the (LR22) tube to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(19) (Post SB PW4ENG 79−76) Install the shields for the No. 4 bearing oil scavenge lines as follows.

(a) Install shield at the (LR05) tube to the (LR21) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 4), View DE.

(b) Install shield at the (LR21) tube to the (LR22) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 7), View E.

(c) Torque the clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(d) Torque the nut and bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(20) (Pre SB PW4ENG 79−76) Install (rear) No. 4 bearing oil pressure tube assembly (LP16) as follows.

(a) Install pressure tube to strainer housing, threads lubricated with Engine Oil P03−001, on exhaust case at approximately 11 o'clock position and to adapter, threads lubricated with Engine Oil P03−001, forward of Flange M at approximately 10 o'clock position. Tighten handtight only.

(b) Install clamps to tube and secure to Flanges M, N, and P brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts, handtight only.

(c) Install clamps, bolt, threads lubricated with Engine Oil P03−001, spacer, and nut securing tube to adjacent scavenge tube rearward of Flange N handtight only.

(d) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nuts (both ends) to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nuts.

(f) (Reference 2151) Install shield to inboard side of forward tube connection and secure in place with clamps. Torque clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(g) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2151) (Pre SB PW4ENG 79−54) Install shield to inboard side of rear tube connection and secure with clamp. Torque clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(h) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 2151) (Post SB PW4ENG 79−54) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Secure the forward end of the shield to the bracket on the diffuser case with a clamp, bolt lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Secure the rear of the shield with a hose clamp and torque to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Reference 2151) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Attach the forward end of the shield to the bracket on the diffuser case with a clamp, bolt lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Attach the rear of the shield with a hose clamp and torque to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(21) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. Also install the No. 4 bearing strainer element as follows.

(a) Attach the coupling nut on the (LP15) tube to the (LP47) tube, handtight only. See Figure 405 (Sheet 9), View LA.

(b) Install clamps and secure with bolts. See Figure 405 (Sheet 9), Views U, T and S.

(c) Install packing, lubricated with Engine Oil P03−001 to the groove in the No. 4 bearing strainer element. See Figure 405 (Sheet 10), View G.

(d) Install the No. 4 bearing strainer element into the No. 4 bearing strainer element housing, handtight only. Lubricate threads with Engine Oil P03−001. See Figure 405 (Sheet 10), View G.

(e) Install the element housing, lubricated with Engine Oil P03−001, on to the tube nut at approximately the 7 o'clock position, handtight only. See Figure 405 (Sheet 10), View G.

(f) Attach the (LP48) tube to the strainer housing and the (LP47) tube, handtight only. See Figure 405 (Sheet 10), Views G and CA.

(g) Install clamps and secure with bolts and nuts as necessary. See Figure 405 (Sheet 11), Views M, N, B1 and P, and (Sheet 12), Views R and F.

(h) Torque the strainer to the strainer housing to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(i) Torque the internal tube nut to the strainer housing to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(j) Torque the (LP48) tube to the strainer housing to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(k) Torque the (LP48) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(l) Torque the (LP15) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(m) Torque all the installed clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(22) (Post SB PW4ENG 79−76) Install the shields for the No. 4 bearing oil pressure lines as follows.

(a) Install shield at the (LP47) tube to the (LP15) tube connection. Secure shield with clamps. See Figure 405 (Sheet 9), View LA.

(b) Install shield at the (LP47) tube to the (LP48) tube connection. Secure shield with clamps. See Figure 405 (Sheet 10), View CA.

(c) Install shield at the (LP48) tube to the strainer housing connection. Secure shield with clamps. See Figure 405 (Sheet 10), View G.

(d) Torque all clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

C. Postrequisites

(1) Install EEC thermocouple and airframe cable (W6) as necessary by 72−00−54, Installation−09 (Task 72−00−54−450−006).

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−06

Task 72−00−53−450−004:

1. Install Turbine Case Cooling (TCC) Air Valve Control Cable

A. Equipment And Materials Required

CONSUMABLE MATERIALS:

ITEM NO.	DESIGNATION
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)

B. Procedure
See Figure 401.

(1) (For engines with Pre SB PW4ENG 75−117 control cable only) (Reference 2010) Hold the cable with a wrench and torque the seal nut (401/2) in the rear of the cable (401/5) to 150 − 200 lb−in. (16.948 − 22.597 N.m) to make sure the bushing (401/3) is seated. The bushing is seated when the resistance to the torque load increases substantially. The torque must not be more than 300 lb−in. (33.895 N.m). Loosen the nut one quarter to one half turn.

(2) (2) (Reference 2010) Move the turbine case cooling (TCC) air valve actuator (401/7) forward on the mount rails until the actuator touches the stop bracket on the forward end of the mount bracket.

NOTE: It is permitted for the actuator to be off the stop by up to 0.125 inch (3.175 mm).

(3) Lubricate the forward coupling nut (401/8) threads with Engine Oil P03−001. Engage the forward end of the cable with the actuator piston shaft and tighten the coupling nut handtight until the nut is seated then loosen the nut one quarter to one half turn.

(4) Turn the cable (401/5) until it engages in the U−shaped slot on the rear support bracket (401/4) and then handtighten the jamnuts (401/6).

NOTE: The jamnuts (401/6) on the cable (401/5) must be installed on each side of the U−shaped slot of the support bracket (401/4) with washers (401/1) between the jamnuts and the bracket.

(5) Check to make sure the actuator (401/7) stayed against the forward bracket stop and that the coupling nut (401/8) turns freely. If the coupling nut does not turn freely, do steps (2), (3), (4) and (5) again.

(6) While you keep the actuator (401/7) forward, make sure the rearward end of the cable stayed seated in the slot of the rear support bracket. Tighten the forward jamnut against the rear support bracket handtight only.

(7) Tighten the rear jamnut against the support bracket handtight only. While you hold the rear jamnut with a wrench, torque the forward jamnut to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 to the jamnuts.

(8) Check to make sure the actuator (401/7) stayed against the forward bracket stop and that the coupling nut (401/8) turns freely. If the coupling nut does not turn freely, do steps (2) through (7) again.

(9) Torque the coupling nut (401/8) to 100 - 125 lb-in. (11.298 - 14.123 N.m). Install the Lockwire P05-289 to the coupling nut.

(10) Attach the cable (401/5) to the adjustable brackets (401/11) with clamps (401/9), bolts (401/12), threads lubricated with Engine Oil P03-001, and nuts (401/10). Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: Do not apply stress to the cable when you install the clamps. If necessary, remove the lockwire from the adjusters (401/13), loosen the jamnuts (401/14) and readjust the adjusters (401/13) to make sure of the correct clamp to bracket installation.

(11) If the adjusters (401/13) were adjusted, do the following.

(a) Torque the jamnuts (401/14), threads lubricated with Engine Oil P03-001, to 14 - 16 lb-in. (1.582 - 1.808 N.m). Install the Lockwire P05-289 to the jamnuts.

NOTE: The cable rod end bearing is installed as part of 72-00-00, Special Procedure-11 Task 72-00-00-830-005.

C. Postrequisites

(1) Rig automatic turbine rotor clearance control system by 72−00−00, Special Procedures−06 Task 72−00−00−830−004 or Special Procedures−11 Task 72−00−00−830−005, as applicable.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-07

Task 72-00-53-450-001:

1. Install Turbine Case Cooling (TCC) Air Valve (LPT)

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure
See Figure 401 and Figure 402.

(1) Move the valve, with flow arrows downward, into position between the upper and lower support brackets while you align the bolt holes.

(2) Attach the upper flange and the upper support link with bolts, threads lubricated with Engine Oil P03-001. Make sure the longer bolt is installed to the inner support link location.

(3) Install the lower support link to the flanges of the HPT and LPT (TCC) manifold collectors and attach the lower flange of the valve and support link with bolts, threads lubricated with Engine Oil P03-001, with the longer bolts at the inner support link location, and nuts.

(4) Torque all the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: You install the HPT/LPT TCC valve linkage during adjustment/test.

C. Postrequisites

(1) Rig TCC system by 72-00-00, Special Procedures-06 Task 72-00-00-830-004.

(2) Test engine by Repair Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL – LOW PRESSURE TURBINE (LPT) – INSTALLATION-08

Task 72-00-53-420-002:

1. Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft

NOTE: See Figure 401 for part/assembly installation procedure sequence.

NOTE: This procedure is for installation of low pressure turbine with turbine exhaust case previously installed.

NOTE: To install the low pressure turbine with the turbine exhaust case previously removed, refer to 72-00-53, Installation-01 (Task 72-00-53-420-001).

A. Prerequisites

(1) See 72-00-53, Inspection/Check-01 Task 72-00-53-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)
PWA 18872	Wrench, Hydraulic (Optional To PWA 33732)
PWA 25040	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 25041	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
PWA 25757	Pedestal, Fixed
PWA 25758	Pedestal, Adjustable
PWA 25926	Adapter (Two Necessary)
PWA 26318	Base, Extension
PWA 28414	Bracket, Support (Optional To PWA 85195 Bracket For Engine Horizontal Support)
PWA 28657	Sling, Strongback, Handling
PWA 29243	Bracket, Support (Two Necessary) (Optional To PWA 85195)
PWA 29389	Pump, Hydraulic

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−08

Special Tools:

(CONTINUED)

PWA 29510	Pump, Hydraulic (Hand) (Use With Hydraulic Wrench)
PWA 33732	Wrench, Hydraulic
PWA 45418	Wrench, Mechanical
PWA 45419	Air Torque Multiplier (Optional To PWA 80651) (Use With Mechanical Wrench)
PWA 76154	Adapter
PWA 76270	Stand
PWA 80071	Wrench, Mechanical
PWA 80187	Wrench, Mechanical
PWA 80651	Multiplier, Pneumatic (Use With Mechanical Wrench)
PWA 85195	Bracket (Two Necessary)
PWA 85291	Pins, Aligning (Two Necessary − Optional To PWA 101152)
PWA 85299	Adapter, Holding (Optional To PWA 102460) (Use With Mechanical Wrench)
PWA 85300	Wrench, Torque (Use With Mechanical Wrench)
PWA 85306	Puller, Knocker
PWA 85452	Eye, Lifting
PWA 85456	Retainer, Front
PWA 85490	Drift
PWA 85504	Gage, Indicator
PWA 85514	Wrench, Torque (Use With Hydraulic Wrench)
PWA 85515	Adapter (Use With Hydraulic Wrench)
PWA 85562	Sleeve, Support
PWA 85769	Fixture (Install/Remove)
PWA 85785	Adapter, Piloting
PWA 86210	Adapter, Piloting (Optional To PWA 85785, Use If The Low Pressure Compressor Is Not Installed)
PWA 86325	Fixture (Optional To PWA 86437)
PWA 86437	Fixture, Retainer (Optional To PWA 88222)
PWA 86604	Stand, Transport (Optional, To Store And Transport PWA 85769 Fixture)
PWA 88204	Guide, Piloting
PWA 88222	Fixture, Retainer
PWA 101152	Pins, Aligning (Two Necessary)
PWA 102460	Adapter (Use With Mechanical Wrench)
PWA 102727	Support
PWA 103636	Base, Support

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P06−002	Petrolatum, White (PMC 9609)
P06−021	Compound, Antigalling (PWA 550)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	8	72−54−00/4/110
Packing	1	72−54−00/5/90

C. Procedure

(1) Install turbine shaft spacer into front end of front compressor drive turbine shaft using PWA 85490 Drift. See Table 401 and Figure 402.

Class	Thickness
1	0.550 − 0.555 Inch (13.970 − 14.097 mm)
2	0.555 − 0.560 Inch (14.097 − 14.224 mm)
3	0.560 − 0.565 Inch (14.224 − 14.351 mm)
4	0.565 − 0.570 Inch (14.351 − 14.478 mm)
5	0.570 − 0.575 Inch (14.478 − 14.605 mm)
6	0.575 − 0.580 Inch (14.605 − 14.732 mm)
7	0.580 − 0.585 Inch (14.732 − 14.859 mm)
8	0.585 − 0.590 Inch (14.859 − 14.986 mm)
9	0.590 − 0.595 Inch (14.986 − 15.113 mm)
10	0.595 − 0.600 Inch (15.113 − 15.240 mm)
11	0.600 − 0.605 Inch (15.240 − 15.367 mm)
12	0.605 − 0.610 Inch (15.367 − 15.494 mm)
13	0.610 − 0.615 Inch (15.494 − 15.621 mm)
14	0.615 − 0.620 Inch (15.621 − 15.748 mm)
15	0.620 − 0.625 Inch (15.748 − 15.875 mm)
16	0.625 − 0.630 Inch (15.875 − 16.002 mm)
17	0.630 − 0.635 Inch (16.002 − 16.129 mm)
18	0.635 − 0.640 Inch (16.129 − 16.256 mm)
19	0.640 − 0.645 Inch (16.256 − 16.383 mm)
20	0.645 − 0.650 Inch (16.383 − 16.510 mm)
21	0.650 − 0.655 Inch (16.510 − 16.637 mm)

Spacer Classification Data
Table 401

(CONTINUED)

Class	Thickness
22	0.655 − 0.660 Inch (16.637 − 16.764 mm)
23	0.660 − 0.665 Inch (16.764 − 16.891 mm)
24	0.665 − 0.670 Inch (16.891 − 17.018 mm)
25	0.670 − 0.675 Inch (17.018 − 17.145 mm)
26	0.675 − 0.680 Inch (17.145 − 17.272 mm)
27	0.680 − 0.685 Inch (17.272 − 17.399 mm)

Spacer Classification Data
Table 401 (Continued)

(2) Position and adjust PWA 102727 Fan Case Support to engage and hold the fan inlet case at Flange "A" at the 6 o'clock location. If it is necessary because of the height of the engine in the pedestals, first install the Fan Case Support (PWA 102727) in a PWA 103636 Base Support. Attach the Fan Case Support (PWA 102727) to the Base Support (PWA 103636) with the three detail bolts and nuts.

NOTE: If necessary several Base Supports (PWA 103636) can be stacked together. They must be attached to each other with the three detail bolts and nuts.

(3) Install PWA 85195 Support Brackets, PWA 25040 Support Brackets and PWA 25041 Support Brackets, or PWA 28414 Support Brackets to turbine exhaust case at 3 and 9 o'clock locations. See Figure 403.

NOTE: PWA 29243 Brackets may be used in place of PWA 85195 Brackets for horizontal support only.

NOTE: PWA 25040 Brackets and PWA 25041 Brackets may be used in place of PWA 85195 Brackets on engines with exhaust nozzle removed.

(a) Position brackets between case rails and align holes.

NOTE: If applicable, install PWA 25040 Bracket at 3 o'clock and PWA 25041 Bracket at 9 o'clock positions.

(b) For PWA 85195 Brackets or PWA 25040 Brackets and PWA 25041 Brackets, install pin from rear through flange and bracket. Secure pin with safety pin as required.

(c) For other brackets, insert pin through flanges and bracket and install bushings through flanges and into bracket. Secure pins with nuts.

(4) If the turbine shaft spline is not clean, or if it has a heavy type of rust preventive, clean the spline by SPOP 209 (wipe method). See Standard Practices Manual, PN 585005.

(5) Using hoist, attach PWA 28657 Sling with two PWA 76154 Adapters to trunnion spools of brackets at 3 and 9 o'clock locations on exhaust case. See Figure 404.

(6) Attach second hoist and nylon sling to front compressor drive turbine shaft.

(7) Lubricate two interface diameters and the spline area at front end of front compressor drive turbine shaft with Engine Oil P03−001. If the shaft is uncoated in the area forward and rearward of the spline, lubricate these areas also. See Figure 405.

(8) Loosen hand knobs and open clamps securing turbine shaft to PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

NOTE: After removal of assembly from stand, PWA 85562 Sleeve or PWA 87347 Sleeve details may be removed from front and rear supports of PWA 25096 Stand, PWA 76270 Stand or PWA 87330 Stand.

CAUTION: DO NOT INSTALL SEAL IN HIGH TURBINE CASES WHICH DO NOT HAVE A SEAL GROOVE IN THE REAR FLANGE. AFFECTED CASES ARE 50L170 AND 50L292.

(9) Install seal to rear flange of high pressure turbine case. Seal may be temporarily secured to flange with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(10) Using hoists, lift low pressure turbine and turbine exhaust case from stand and align shaft with high pressure compressor rear hub.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSTALLATION−08

(11) If the fan nut and the turbine shaft coupling are in place, install PWA 85785 Adapter in the ID of the fan nut. Use the detail clamps to attach the adapter to the coupling lugs. See Figure 406.

(12) Optional, if the fan nut and turbine shaft coupling are not in place, install PWA 85785 Adapter in the 11.120 inch (282.448 mm) diameter of the fan hub. Use the detail clamps to attach the adapter to the underside of the hub flange. See Figure 406.

(13) Optional, if the low pressure compressor is not in place, install PWA 86210 Adapter to the ID of the No. 1 bearing support. Use the detail clamps to attach the adapter to the support. See Figure 407.

(14) Thread the puck end of PWA 88204 Guide into the front end of the turbine shaft. See Figure 408.

NOTE: The guide can be separated into two parts if required.

(15) Hand guide the assembly from the rear and move the assembly forward. Move the nylon sling as required and insert the guide through the ID of the PWA 85785 Adapter or PWA 86210 Adapter.

(16) Move the assembly forward until the turbine shaft engages the ID spline of the turbine shaft coupling at the front end of the engine.

(17) Remove nylon sling and hoist from turbine shaft. Move assembly forward until approximately 12 inches (304.80 mm) gap exists between turbine front and rear cases.

(18) Remove the retainer (409/3) from the front flange of the turbine rear case and the front compressor drive turbine shaft. See Figure 409.

(a) Remove two bolts (409/4) that attach the upper and lower details of the retainer.

(b) Remove bolts (409/2) and nuts (409/1) securing upper and lower retainer details to low pressure turbine case.

(19) Install several work bolts and nuts to boltholes in Flange N.

(20) Remove the PWA 85785 Adapter or PWA 86210 Adapter as applicable.

(21) Remove the guide from the turbine shaft.

(22) Install two PWA 85291 Aligning Pins or PWA 101152 Aligning Pins.

  (a) Locate two threaded jackscrew holes 180 degrees apart in front flange of turbine rear case.

  (b) Insert pins through boltholes between jackscrew holes from rear side of front flange.

  (c) Thread detail bolts into jackscrew holes to secure pins.

(23) Install PWA 85769 Fixture (Pusher) into front end of low pressure turbine shaft. See Figure 410.

  (a) Thread plug end of shaft (410/1) into end of turbine shaft until plug bottoms on shoulder of shaft.

  (b) Guide body (410/4) and attached parts over previously installed shaft (410/1). Using dowel pin (410/2), retract locking pin. Rotate assembly to position locating plate behind lugs at front end of low pressure turbine coupling. Using dowel pin, release spring loaded locking pin to lock fixture to coupling.

  (c) Install puck (410/5) onto shaft, and engage small diameter of puck into body (410/4).

  (d) Guide hydraulic cylinder (410/6), threaded end first, onto shaft. Secure cylinder with nut (410/7).

CAUTION: LOOSEN THE EIGHT CAP SCREWS (411/3) OF THE RETAINING FIXTURE WHEN FRONT FLANGE OF REAR CASE MEETS REAR FLANGE OF TURBINE FRONT CASE TO AVOID DAMAGE TO NO. 1 BEARING IF TURBINE SHAFT COUPLING SPACER IS BELOW REQUIRED DIMENSIONS.

(24) Tighten workbolts in Flange N and apply hydraulic pressure to pusher−puller ram and seat front compressor drive turbine shaft in LPC/LPT coupling. Front flange

of turbine rear case should now butt rear flange of turbine front case.

(25) Remove PWA 86325 Retainer, PWA 86437 Retainer or PWA 88222 Retainer from the turbine exhaust case and shaft. See Figure 411 (Sheet 1) or Figure 411 (Sheet 2).

CAUTION: TO ENSURE PROPER SEATING OF CLASSIFIED SPACER, HYDRAULIC PRESSURE MUST BE APPLIED TO PUSHER−PULLER, WHEN PERFORMING LOW PRESSURE TURBINE POSITIONING CHECK.

(26) (Reference 847 or 851) Check low pressure turbine axial position using PWA 85504 Gage while pressure is applied to pusher puller. See Figure 412 and Figure 413.

NOTE: If the coupling is not installed, then install the classified spacer for the low turbine running position during the LPC/LPT coupling 72−00−32, Installation−01 (Task 72−00−32−420−001).

NOTE: Running position check is required whenever low pressure turbine is installed, (except when the LPC/LPT coupling is not in place) regardless of whether same or different unit (from another engine) is installed. Measurement should be an average of at least two measurements taken at equally spaced locations.

(a) (Reference 847) For engines (Pre SB PW4ENG 72−256) without the revised LPT airfoils, 5th stage turbine hub, and 5th stage airseal, you must remove two screws (412/7) and gage plate (412/8) from the top of the bar if it is there. Put the gage plate and screws in the storage location on the bar.

(b) (Reference 851) For engines (Post SB PW4ENG 72−256) with the revised LPT airfoils, 5th stage turbine hub, and 5th stage airseal, put the gage plate (412/8) on the top of the bar (412/2) with two screws (412/7).

(c) Move the dial indicator with its support block away from the spring−loaded rod (412/4).

(d) Push the spring−loaded flush pin assembly (412/6) into tubular housing and rotate to engage the dowel pin (412/5) in the slot to secure the flush pin.

(e) Find the 1.0 inch by 1.5 inch (25.4 mm by 38.1 mm) slot in the inner front flange of the turbine exhaust case at either the 12 o'clock or 6 o'clock location.

(f) Put the bar (412/2) between two exhaust case struts and next to one of the slots in the case inner front flange.

(g) Put the gage bar on two rear flanges (inner and outer) of the turbine exhaust case and put the flush pin assembly over the 6th stage LPT disk (412/9). Hold the gage to the case with two bolts (412/3) and nuts (412/1).

(h) Release the rod from the locked position and allow the flush pin to touch the disk. Make sure that the flush pin touches the disk and not the blade (you can rotate the rotor if necessary).

(i) Zero the dial indicator on the back face of the bar.

(j) Move the dial indicator into position over the spring−loaded rod (412/4) to read the turbine running position.

(k) (Reference 851) For engines (Post SB PW4ENG 72−256), with the revised LPT airfoils, 5th stage turbine hub, and the new 5th stage airseal, the low pressure turbine axial running position must be within the limits specified for (Reference 851). See Figure 413.

NOTE: Mean dimension of 12.330 inches (313.182 mm) is indicated when rod detail of tool is flush with gaging surface.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-08

(l) (Reference 847) For engines (Pre SB PW4ENG 72-256), without the revised LPT airfoils, the new 5th stage turbine hub, and the new 5th stage airseal, the low pressure turbine axial running position must be within the limits specified for (Reference 847). See Figure 413.

NOTE: Mean dimension of 12.380 inch (314.452 mm), is indicated when rod detail of tool is flush with gaging surface.

(m) Remove the gage and repeat measurement at the opposite slot location.

(n) If necessary, remove front compressor drive turbine with exhaust case and use a new classified spacer.

1 Make record of axial running position dimension. This dimension will be used to find new spacer class.

2 Remove The Front Compressor Drive Turbine. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002).

3 Remove classified spacer from end of turbine shaft. Measure and make a record of spacer thickness.

4 Find the new classified spacer necessary to correctly set the running position of the low pressure turbine. Spacer class is found using Table 401.

NOTE: Class of turbine shaft spacer can be changed by 72-53-81, Repair-01. See PW4000 Series CIR, PN 51A357.

5 Install new classified spacer onto end of turbine shaft.

6 Install front compressor drive turbine, with new classified spacer, again.

7 Check axial running position dimension again.

(27) Secure No. 4 bearing retaining plate using bolts lubricated with Engine Oil P03-001 and key washers. Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend tabs of key washers. See Figure 414.

(28) Release hydraulic pressure. Disconnect hydraulic pump.

(29) Remove PWA 85769 Puller from engine.

(a) Using dowel pin (410/2), retract locking pin into housing. Rotate body (410/4) to position lugs of locator plate between lugs of LPC/LPT coupling. Remove body from coupling.

(b) Unthread and remove shaft (410/1) from turbine shaft.

(30) Remove two PWA 85291 Guide Pins or PWA 101152 Guide Pins from Flange N.

(31) Install Flange N hardware. Refer to 72-00-53, Installation-20 (Task 72-00-53-420-020).

(32) Install two PWA 25926 Adapters, one on one PWA 25757 Pedestal and second on one PWA 25758 Pedestal.

(33) Using previously attached sling, hoist and adapters at turbine exhaust case, lift rear of engine and position pedestals under brackets at 3 and 9 o'clock positions on exhaust case.

(34) Remove PWA 26157 Pedestal and PWA 85062 Saddle from diffuser/combustion section.

(35) Lower engine to pedestals and remove PWA 28657 Sling and hoist.

(36) Assemble LPT flat washer (415/4) into ID of LPC/LPT coupling. See Figure 415.

NOTE: If LPC/LPT coupling is removed, omit installation of turbine shaft nut, No. 4 bearing cover and associated hardware specified in following steps. These parts are to be installed with coupling per 72-00-32, Installation-01 (Task 72-00-32-420-001).

(37) Apply Antigalling Compound P06−021, to turbine shaft nut areas specified in Figure 416. Cure compound for five minutes minimum prior to assembly.

(38) Thread turbine shaft nut (415/3) into front compressor drive turbine shaft.

(39) For operators that use the mechanical wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Install PWA 102460 Adapter or PWA 85299 Adapter into LPC/LPT coupling. See Figure 417.

1 Loosen wing nuts (417/1) and slide three clamps (417/2) radially inward.

2 Align keys in adapter with internal slots in coupling and install adapter in coupling. Index adapter as necessary to seat keys in slots in coupling. Slide three clamps radially outward to engage lugs of coupling. Tighten wing nuts to secure clamps.

(b) Install PWA 85300 Wrench, smaller splined end first, into center of PWA 102460 Adapter or PWA 85299 Adapter. Align spline of wrench with spline in ID of turbine shaft nut. Push wrench inward to seat on face of nut.

(c) Using hoist, align splines and slide applicable mechanical wrench over splines of PWA 85300 Wrench. Align anti−torque pins in wrench with bushings in adapter and seat wrench against adapter face. See Table 402 for mechanical wrench options.

PWA Mechanical Wrench	PWA Torque Multiplier
45418	45419
80071 or 80187	45419 or 80651

Mechanical Wrench Options
Table 402

(40) For operators that use the hydraulic wrench to install the No. 3 bearing retaining nut, install tooling as follows:

(a) Align boltholes and position PWA 85515 Adapter to rear face of PWA 18872 Wrench or PWA 33732 Wrench. Secure adapter with eight bolts (418/3). See Figure 418.

(b) Using hoist, position wrench and adapter assembly into front end of LPC/LPT coupling. Align teeth of adapter with slots in coupling and slide three clamps (418/1) outward to engage lugs of coupling. Tighten wing nuts (418/2) to secure adapter to coupling.

NOTE: PWA 28815 Cart or PWA 75046 Cart can be used to transport PWA 18872 Wrench or PWA 33732 Wrench and PWA 28814 Pump or PWA 29510 Pump.

(c) Install PWA 85514 Wrench, smaller splined end first, into center of PWA 18872 Wrench or PWA 33732 Wrench. Align spline of wrench with spline in turbine shaft nut (418/4). Push wrench inward to seat on face of nut.

(d) Connect PWA 28814 Electric Pump or PWA 29510 Hand Pump to wrench.

CAUTION: PWA 80651 TORQUE MULTIPLIER MUST NOT BE USED WITH PWA 45418 WRENCH OR DAMAGE TO WRENCH MAY OCCUR.

(41) (Reference 971) Torque turbine shaft nut.

NOTE: Wrenches may be actuated using air torque multipliers per Table 402.

(a) Tighten nut to 5000 − 7000 lb−in. (564.924 − 790.894 N.m), turn nut through an angle of 43 − 47 degrees. Loosen nut to zero.

(b) Tighten nut to 4000 − 6000 lb−in. (451.939 − 677.909 N.m).

(c) Establish common reference points between nut and its mating part.

(d) Turn nut through an angle of 43 − 47 degrees.

(e) Loosen nut to zero and repeat step (b).

(f) If nut reference point is in line with mating part reference point or beyond it within two degrees maximum, apply final angle of turn per step (d).

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order, until reference points are within limits. Then perform step (f).

(42) Remove tooling from coupling.

(43) Install key washer (419/6) and retaining ring (419/5) to secure turbine shaft nut. Make sure retaining ring is fully inserted in the retaining nut groove, all around, and ring end gap is 0.010 inch (0.254 mm) minimum. Remove guide from hub. See Figure 419.

(44) Install new packing (419/4) lubricated with Petrolatum White P06−002, to turbine shaft plug (419/3). Install plug to coupling ID and secure with key washer (419/2) and retaining ring (419/1). See Figure 419.

(45) Install No. 4 bearing oil scavenge (inner) tube. See Figure 420.

(a) Remove protective cover from the mount pad recess in turbine exhaust case rear inner diameter.

(b) Install new gasket (420/3) in groove in recess in exhaust case rear inner diameter.

(c) Align boltholes in flange of No. 4 bearing oil scavenge tube (420/8) with boltholes in recessed mount pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (420/6) lubricated with Engine Oil P03−001 and key washers (420/7). Torque bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Bend tabs of key washers.

(46) (Pre SB PW4ENG 72−472) Install the No. 4 bearing (oil) nozzle and the No. 4 bearing packing transfer tube in the exhaust case No. 4 bearing compartment at the 1:30 o'clock position. See Figure 421.

(a) Install the nozzle (421/4) in the exhaust case and secure with key washers (421/2 and 421/3) and bolts (421/1). Bend the tabs on the key washers.

(b) Install the No. 4 bearing packing transfer tube (421/5) to the No. 4 bearing nozzle (421/4) and secure with key washers (421/6 and 421/7) and bolts (421/8). Bend the tabs on the key washers.

(47) (Post SB PW4ENG 72−472) Install No. 4 bearing (oil) nozzle and No. 4 bearing damper supply tube. See Figure 422.

(a) Install the No. 4 bearing nozzle (422/11) in the port in the pad on the exhaust case rear inner diameter at the 1:30 o'clock position. Install the nozzle with two bolts (422/16 and 422/17), with threads lubricated with Engine Oil P03−001, and two washers (422/16 and 422/17).

(b) Install the No. 4 bearing damper supply tube (422/12) through the 0.380 inch (9.652 mm) diameter hole in the nozzle (422/11) and into the port in the exhaust case rear flange. Install the damper tube with two bolts (422/16 and 422/17) with threads lubricated with Engine Oil P03−001, and washers (422/16 and 422/17). Torque the bolts that attach the nozzle to the exhaust case and bolts that attach the damper supply tube to the nozzle to 75 − 85 lb−in. (8.474 − 9.604 N.m). Bend the tabs of washers.

(48) (Post SB PW4ENG 72−472) Install No. 4 bearing front nozzle assembly and the packing transfer tube (damper tube to front nozzle). See Figure 422 (Sheet 1) and (Sheet 2).

(a) Lubricate two packings (422/14) with Engine Oil P03−001. Install the packings in the grooves of the packing transfer tube (422/15). Insert one end of the tube into the port in the front No. 4 bearing nozzle (422/13).

(b) Align the boltholes in the flange of the front nozzle with the two retainer plate boltholes at the 12 o'clock position; and insert the nozzle through the hole in the No. 4 bearing support flange at the 1:30 o'clock position. Insert the end of the transfer tube in the port in the elbow of the No. 4 bearing damper supply tube. Put the retaining plate (422/2), chamfered side out, on the retainer plate pad (under the nozzle flange). Put the key washer (422/1) over the oil nozzle flange, and install two bolts, with threads lubricated with Engine Oil P03−001.

(c) (Reference 90) Make sure that the clearance gap (422/3) between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2, Figure 423. Torque the bolts that attach the retainer plate to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(d) Bend the tabs of washer (422/1).

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

(49) Install the No. 4 bearing cover as follows: See Figure 424.

(a) Apply Engine Oil P03−001 fully to the new packing (424/2).

(b) Install the new packing into the groove at the rear flange of the No. 4 bearing cover (424/3).

(c) Install the cover into the rear inner flange of the exhaust case (424/5).

(d) Install 4 work bolts equally spaced around the cover.

(e) Tighten the bolts equally in small increments to pull the cover into position equally.

(f) Monitor the engagement of the cover to make sure the packing is not cut.

(g) Remove the work bolts.

(50) Install the No. 4 bearing heat shield (424/4) into recess in the No. 4 bearing shield (424/5). Align bolt holes and install shield over No. 4 bearing cover at the rear inner flange of the exhaust case. Install the shield with 30 bolts, lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(51) (Post SB PW4ENG 79−76) Install No. 4 bearing (oil) pressure tube. See Figure 425.

(a) Remove protective cover from adapter (425/5).

NOTE: The No. 4 bearing (oil) pressure tube of (Pre SB PW4ENG 79−76) would not have been removed for split−shipment.

(b) No. 4 bearing pressure tube option to prevent possible wear to the No. 4 bearing pressure tube (425/14), a fiberglass tape wear Wrap P05−136, (425/17) is provided as an option.

(c) Install the shield set (425/15) and the heat shield insulation slide clamp (425/16) on the elliptical section of the No. 4 scavenge tube (425/14).

NOTE: The shield is installed on the section of the tube that goes through the strut of the turbine exhaust case.

(d) Install the shield set (425/7) on the No. 4 pressure tube as follows.

1 Place the two halves over the round section of tube.

2 Install one restraining strap (425/18) through the loops on the section of the shield that overlaps the shield set (425/15).

3 Make tight the shield set on the tube by pulling the strap tight. Cut off excess strap material.

4 Put the loop clamp (425/10) on the wear sleeve of the shield set and secure temporarily with a work bolt and nut.

(e) Attach bracket (425/11) to the turbine exhaust case with two bolts (425/8). Torque the bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(f) Install the No. 4 pressure tube through the strut at the 4:30 o'clock position.

1 Attach the tube nut to the adapter (425/5), handtight.

NOTE: The shield may be separated to attach the tube nut to the adapter.

2 Remove the work bolt and replace with bolt (425/9) and nut (425/12) and attach to the bracket (425/11).

3 Torque the tube nut to the adapter (425/5) to 225 − 250 lb−in. (25.422 − 28.246 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nut.

4 Torque the bolt (425/9) that attaches the clamp (425/10) to the bracket (425/11) to 32 − 36 lb−in. (3.616 − 4.067 N.m).

5 Install the four additional straps (422/18) to hold the shield in place.

6 Make tight the shield set on the tube by pulling the straps tight. Cut off excess strap material.

7 Install bracket (425/2) over the outboard end of the tube.

8 Position the nut (425/4) on the outboard end of the tube and secure the nut to the tube with thrust wire (425/19).

9 Attach the tube shield (425/3) to the turbine exhaust case at the 4:30 o'clock position, pushing it on over the nut (425/4). Line up the shield with the bracket (425/2).

10 Install two bolts (425/1) to retain shield and bracket and torque to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts.

D. Postrequisites

(1) Install The Compressor Inlet Cone. Refer to 72−00−31, Installation−02 (Task 72−00−31−420−001).

(2) Install The External Parts. Refer to 72−00−53, Installation−03 (Task 72−00−53−420−003).

(3) Install The External Parts. Refer to 72−00−54, Installation−02 (Task 72−00−54−420−003).

(4) Install The EEC Thermocouple And Airframe Cable (W6). Refer to 72−00−54, Installation−09 (Task 72−00−54−450−006−A00).

(5) Airflow Check The No. 4 Bearing Oil Nozzle. Refer to 72−54−00, Assembly−01, (Task 72−54−00−400−001).

(6) Test the engine per the Repair Test Reference Table. Refer to 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-09

Task 72-00-53-420-002-002:

1. Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft (Hydraulic Wrench) Deleted

A. Procedure

(1) This procedure is relocated to 72-00-53, Installation-08 (Task 72-00-53-420-002).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSTALLATION-20

Task 72-00-53-420-020:

1. Install The Flange N Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

B. Procedure

(1) Install the Flange N hardware as follows. See Figure 401 and Figure 402.

(a) Apply Engine Oil P03-001 to the bolts.

NOTE: Boltholes are numbered clockwise from the rear. The Index pin is located between boltholes 64 and 65.

(b) Install the bolts and brackets to Flange N and attach with nuts handtight only.

NOTE: Remove the work bolts and replace them with the engine bolts one at a time to keep the case seated.

NOTE: Numbers in parenthesis in the figure are the bolthole locations of the brackets.

(c) (Reference 978) Torque the Flange N bolts as follows.

1 Nuts must be tightened simultaneously in sets of two groups. Sets consist of groups number (1,2), (3,4), (5,6), (7,8), (9,10),(11,12) (13,14) and (15,16). See torque sequence specified in reference figure.

NOTE: Eight of the 14 groups consist of eight bolts each. The remaining two groups consist of nine bolts each. See reference Figure 402.

2 Tighten all sets of bolt groups described in previous step to initial torque of 75 − 100 lbf−in (8.474 − 11.298 N.m).

3 Tighten all set of bolt groups described in previous step to final torque of 180 − 200 lbf−in (20.337 − 22.597 N.m).

4 Install Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the bolts at bolthole Locations 11 through 14, 39 through 42, 76 through 79, and 98 through 101.

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

Task 72-00−53−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	IFR	Description	New Part Reference Dimensions Min	Max	Limits Min	Max

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-02

Task 72-00-53-200-002:

1. Visually Inspect Low Pressure Turbine

R A. General Inspection - Low Pressure Turbine (LPT)

R (1) For inspection limits applicable to installed (that you
R can access) parts of low pressure turbine module, refer
R to Inspection/Check-10 (Task 72-00-53-210-010).

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-03

Task 72-00-53-200-003:

1. Inspect Front Compressor Drive Turbine (LPT) Shaft Splines

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Clean the shaft splines before you do the fluorescent penetrant inspection. See SPOP 208 in the Standard Practices Manual, PN 585005. Use a brass wire brush to remove loose material from the splines.

      (2) Do a local fluorescent penetrant inspection on the spline area. See Figure 801 for applicable areas of the shaft. See SPOP 70, ultra high sensitivity, in the Standard Practices Manual, PN 585005.

         (a) Carefully inspect the areas shown in Figure 801.

      (3) Shaft inspection limits.

         (a) If linear indications at 45 degrees to the axis of the shaft are found, the shaft must be removed from the LPT module and inspected by 72-53-80, Inspection/Check-02 of the PW4000 Series CIR, PN 51A357.

         (b) See 72-53-80, Inspection/Check-03, CONFIG-1, of the PW4000 Series CIR, PN 51A357 for servicable limits of other types of indications.

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Task 72-00-53-210-010:

1. Visually Examine The Low Pressure Turbine (LPT) Module Assembly - Engine General

A. Equipment And Materials Necessary

Special Tools:

PWA 86543	Gage

B. General Inspection Limits

NOTE: All applicable Airworthiness Directives (AD) must be complied with and these directives takes precedence over all inspections or repairs given in this module inspection.

(1) This inspection does not permit time since overhaul to be set to zero.

(2) These procedures give instructions for the visual inspection of the low pressure turbine (LPT) module assembly after removal from the engine. Do these procedures before you do the preservation, packing or module installation procedure. This procedure is to find those easy to see types of damage, which can make it necessary to do more disassembly, inspection or repair. Refer to Section 70-31-00 for the general visual inspection instructions in the Standard Practices Manual, PN 585005.

(3) The inspection table in this section is applicable to the low pressure turbine (LPT) modules with some, none or all of the components installed. You do not have to disassemble the module assembly to do this inspection. You can choose to apply individual limits to those areas that are visible at all stages of disassembly. If a condition shows that there can be damage that you cannot see, remove a component to fully examine the damaged area. Use the applicable procedures in this manual to remove the component and do an inspection by step (4).

(4) Remove all the components that you find not serviceable at the modular level. Send the applicable components for more inspection and repair at the component level maintenance. Refer to Section 72-53-00 in the PW4000 Series CIR, PN 51A357.

(5) Unless given differently, not toleranced areas given in this section are to corners, points of tangency between the surfaces or at the points opposite to one of these locations. The areas shown will have a tolerance of plus 0.125 inch (3.175 mm) in all directions unless adjacent areas are given as areas where damage is not permitted.

C. Procedure

(1) Examine the external low pressure turbine (LPT) case. See Table 801 and Figure 801.

(2) Examine the turbine case front inner rail. See Table 802 and Figure 802.

(3) Examine the turbine case cooling manifolds and supply tubes. See Table 803 and Figure 803.

(4) Examine the Stage 3 outer (transition) duct segments, flow guide seal and seals between the segments. See Table 804 and Figure 804 (Sheet 1), Figure 804 (Sheeet 2) and Figure 804 (Sheet 3).

(5) Examine the Stage 3 inner (transition) duct segments for wear, damage and coat condition. Examine the seals between the segments. See Table 805 and Figure 805.

(6) Examine the inner and outer seals between the Stage 3 vane cluster assemblies. See Table 806 and Figure 806.

(7) Examine the Stage 3 vane airfoil surfaces. See Table 807 and Figure 807.

(8) Examine the Stage 3 blade airfoil surfaces. See Table 808 and Figure 808.

(9) Examine the Stage 3 inner rotating airseal surfaces. See Table 809 and Figure 809.

(10) Examine the inner air sealing ring assembly. See Table 810 and Figure 810.

NOTE: If the Stage 3 (inner) rotating airseal assembly is removed, do not use Table 809 and Figure 809. Examine the rotating airseal by Section 72-53-38, Inspection/Check-03 in the PW4000 Series CIR, PN 51A357.

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

R (11) Examine the Stages 3, 4, 5 and 6 disks. See Table 811 and Figure 811 (Sheet 1), Figure 811 (Sheet 2).

R NOTE: Examine the Stage 3 disk only if the inner rotating airseal is removed. The disk cannot be seen if the inner rotating airseal is installed.

R (12) Examine the Stage 6 blade airfoil surfaces. See Table 812 and Figure 812.

R (13) Examine the Stage 6 vane airfoil surfaces. See Table 813 and Figure 813.

R (14) Examine the LPT shaft surfaces. See Table 814 and Figure 814.

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	LPT case surface: See Figure 801			
R	1 Front and rear flange boltholes	Not permitted	Remove the raised material only. No other material removal is permitted.	Refer to Section 72−53−17, Repair−05 in the PW4000 Series CIR, PN 51A357
R	2 Front and rear flanges	Nicks and dents to a maximum of 0.004 inch (0.102 mm) depth	Blend surface damage to a maximum of 0.010 inch (0.254 mm) depth and to a maximum of 20 percent of one surface and to a maximum of 80 percent of the radial width of the surface.	Refer to Section 72−53−17, Repair−05 in the PW4000 Series CIR, PN 51A357
R	3 Case outer surface	Nicks and dents to a maximum of 0.004 inch (0.102 mm) depth	Blend surface damage to a maximum of 0.010 inch (0.254 mm) depth unless given differently.	Refer to Section 72−53−17, Repair−05 in the PW4000 Series CIR, PN 51A357

R Rear Turbine (LPT) Case Surface Damage Inspection
R Table 801

	Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
R	1	0.300 inch (7.620 mm) reference		
R	2 Front inner rail crack width	The total width of all the cracks measure at 0.300 inch (7.620 mm) radial depth must not be more than 0.050 inch (1.270 mm). Do not include the width of the cracks that are less than 0.300 inch (7.620 mm) radial length.	Stop drill to a maximum of 43 cracks and with a radial length of 0.300 - 0.425 inch (7.6 - 10.8 mm)	Refer to Section 72-00-53, Repair-01 in the PW4152 Series Engine Manual, PN 50A443
R			Replace the front flange and inner rail, if more than 43 cracks or individual crack radial length is more than 0.425 inch (10.795 mm).	Refer to Section 72-53-17, Repair-24 and Repair-52 in the PW4152 Series Engine Manual, PN 50A443
R	3	All cracks to a maximum of 0.300 inch (7.620 mm) radial length		

R Front Inner Rail Visual Inspection
R Table 802

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Cracks in all areas	Not permitted	See the repair	Refer to Section 72−09−76, Repair−01 in the PW4000 Series CIR, PN 51A357
Dents in all areas	0.100 inch (2.540 mm) maximum	All quantities, depth, length and width	Refer to Section 72−09−76, Repair−01 in the PW4000 Series CIR, PN 51A357
Nicks, scratches and wear in bends and corners	0.005 inch (0.127 mm) maximum	See the repair	Refer to Section 72−09−76, Repair−01 in the PW4000 Series CIR, PN 51A357
Nicks and scratches in circular sections and flat areas	0.005 inch (0.127 mm) maximum	0.005 − 0.010 inch (0.127 − 0.254 mm)	Smoothly blend in all the directions
		All quantities more than 0.010 inch (0.254 mm)	Refer to Section 72−09−76, Repair−01 in the PW4000 Series CIR, PN 51A357
Wear in circular sections and flat areas	0.010 inch (0.254 mm) maximum	See the repair	Refer to Section 72−09−76, Repair−01 in the PW4000 Series CIR, PN 51A357

LPT Case Cooling Manifold And Supply Tubes Visual Inspection
Table 803

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Wear in the 14 air supply tubes	Not permitted	None, replace the worn tubes	Refer to Section 72-09-76, Repair-02 in the PW4000 Series CIR, PN 51A357
		Patch repair the worn tubes. See the repair for the limits.	Refer to Section 72-09-76, Repair-05 in the PW4000 Series CIR, PN 51A357
Wear in the rear mount guides	0.020 inch (0.508 mm) maximum	All quantities more than 0.020 inch (0.508 mm)	Refer to Section 72-09-76, Repair-03 in the PW4000 Series CIR, PN 51A357
Wear in the front bracket rod	0.020 inch (0.508 mm) maximum	All quantities more than 0.020 inch (0.508 mm)	Refer to Section 72-09-76, Repair-04 in the PW4000 Series CIR, PN 51A357

LPT Case Cooling Manifold And Supply Tubes Visual Inspection
Table 803 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Outer duct segments for: See Figure 804 (Sheet 1).			
PWA 73 coat chipping	The total area of the chipping must not be more than 0.500 inch (12.700 mm) diameter circle for each segment	Coat can be replaced	Refer to Section 72-53-29, Repair-05 and Repair-15 in the PW4000 Series CIR, PN 51A357
1 Featherseal seal gap	A maximum of three seals can be displaced and can have to a maximum of 0.030 inch (0.762 mm) gap	If the gap is more than the serviceable limit, repair.	Refer to Section 72-00-53, Repair-02 in the PW4152 Series Engine Manual, PN 50A443
2 Missing or damaged featherseal	For three separate seals to a maximum of 30 percent of the axial length of the seal can be missing, cracked, eroded or one full seal can be missing	If the damage is more than the serviceable limit, repair.	Refer to Section 72-00-53, Repair-02 in the PW4152 Series Engine Manual, PN 50A443
Duct segment flow guide seal for: See Figure 804 (Sheet 2).			

Stage 3 Outer (Transition) Duct Segment
Seals And Seal Plates Inspection
Table 804

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
3			
Crack(s)	A maximum of two cracks for each duct segment seal (flow guide) are permitted.	Cracks to a maximum of 0.500 inch (12.700 mm) in length	Refer to Section 72-53-29, Repair-17 in the PW4000 Series CIR, PN 51A357
	Crack(s) can traverse towards the front of the seal or towards the inner diameter.	No limit	Refer to Section 72-53-29, Repair-11 in the PW4000 Series CIR, PN 51A357
4			
Rivets	A maximum of four loose rivets are permitted for each duct segment	No limit	Refer to Section 72-53-29, Repair-11 in the PW4000 Series CIR, PN 51A357
Nicks, dents and surface damage	All quantities to a maximum of 0.015 inch (0.381 mm) depth	No limit	Replace the seal. Refer to Section 72-53-29, Repair-11 in the PW4000 Series CIR, PN 51A357.
Local deformation	Local surface deformation to a maximum of 0.015 inch (0.381 mm) depth	Local surface deformation to a maximum of 0.030 inch (0.762 mm) depth and to a maximum of 0.200 inch (5.080 mm) length	Refer to Section 72-53-29, Repair-18 in the PW4000 Series CIR, PN 51A357

Stage 3 Outer (Transition) Duct Segment
Seals And Seal Plates Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
		axially at one location.	
Seal wear	0.020 inch (0.508 mm) minimum thickness to a maximum of 0.150 sq−in (97. sq−mm) for each incident	0.020 inch (0.508 mm) minimum thickness and more than 0.150 sq−in (97. sq−mm) for each incident	Refer to Section 72−53−29, Repair−17 in the PW4000 Series CIR, PN 51A357
Duct segment deflection. See Figure 804 (Sheet 3)	0.100 inch (2.540 mm) maximum deflection for each segment	No limit	Replace the duct segment

NOTE: Use PWA 86543 Gage to measure the deflection of the ducts at the approximate center of each duct segment. Press down on the gage approximately 1.000 inches (25.400 mm) from the end of the tool. Measure the deflection at the forward end of the gage as shown in Figure 804 (Sheet 3). The gage is divided into increments of 0.050 inch (1.270 mm).

Stage 3 Outer (Transition) Duct Segment
Seals And Seal Plates Inspection
Table 804 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 Duct segment coated area chipped or missing	A maximum of 0.175 inch (4.445 mm) from the rear edge for the full width of the segment is permitted. Maximum depth of surface degradation to a maximum of 0.020 inch (0.508 mm).	Coat must be touched up	Refer to Section 72-53-18, Repair-01 in the PW4000 Series CIR, PN 51A357
		Coat must be replaced	Replace the coat. Refer to Section 72-53-18, Repair-02 and Repair-11 in the PW4000 Series CIR, PN 51A357.
2 Seal gap. See Figure 805.	A maximum of three seals can be displaced and can have a maximum of 0.030 inch (0.762 mm) gap.		
3 Missing or damaged seals	A maximum of 30 percent of the axial length of the seal can be missing, cracked or eroded	Replace the damaged or missing seals	Refer to Section 72-53-18, Repair-05 in the PW4000 Series CIR, PN 51A357

Stage 3 Inner (Transition) Duct Inspection
Table 805

R ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 3 vane cluster outer seals for: See Figure 806.			
Missing or damaged seals	To a maximum of two seals can be out of the slots and bent above the vane platform or be missing. Bent seals that are loose must be removed. A total number of two seals can be damaged, missing and removed. The damaged, missing or removed seals must be separated by a 45 degree arc minimum.		

Stage 3 Outer Seals Between The Vane Segments
Table 806

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
All areas for cracking, tearing and sulfadation	Not permitted	See the repair	Replace the vane
Airfoil for surface damage in: See Figure 807.			
Area A	0.030 inch (0.762 mm) maximum depth round bottom dents	See the repair	Refer to Section 72-53-23, Repair-01 in the PW4000 Series CIR, PN 51A357
Area B	0.015 inch (0.381 mm) maximum depth round bottom dents	See the repair	Refer to Section 72-53-23, Repair-01 in the PW4000 Series CIR, PN 51A357
Area C	0.020 inch (0.508 mm) maximum depth round bottom dents	See the repair	Refer to Section 72-53-23, Repair-01 in the PW4000 Series CIR, PN 51A357

Stage 3 Vane Inspection
Table 807

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
All areas for cracking, tearing and sulfadation	Not permitted	No limit	Replace the blade
Blade surface damage in: See Figure 808.			
Area A for:			
Nicks	All quantities to a 0.015 inch (0.381 mm) maximum depth	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Round bottom dents	All quantities to a maximum of 0.020 inch (0.508 mm) depth or 0.125 inch (3.175 mm) diameter metal displacement	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Loss of coat	No limit		
Burning and erosion	All quantities to a maximum of 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) diameter maximum	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Area B for:			
Nicks	Not permitted	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357

Stage 3 Blade Inspection
Table 808

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Round bottom dents	All quantities to a maximum of 0.010 inch (0.254 mm) depth or 0.125 inch (3.175 mm) diameter metal displacement	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357
Burning and erosion	All quantities to a maximum of 0.010 inch (0.254 mm) depth or 0.300 inch (7.620 mm) diameter metal displacement	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357
Area C for:			
Nicks	All quantities to a maximum of 0.015 inch (0.381 mm) depth.	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357
Round bottom dents	All quantities to a maximum of 0.020 inch (0.508 mm) depth or 0.125 inch (3.175 mm) diameter metal displacement	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357
Loss of coat	No limit		
Burning and erosion	All quantities to a maximum of 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) maximum diameter	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357

Stage 3 Blade Inspection
Table 808 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area D for:			
Nicks	All quantities to a maximum of 0.015 inch (0.381 mm) depth	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Round bottom dents	All quantities to a maximum of 0.020 inch (0.508 mm) depth or 0.125 inch (3.175 mm) diameter metal displacement	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Loss of coat	No limit		
Burning and erosion	All quantities to a maximum of 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) maximum diameter	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Area E for:			
Nicks	All quantities to a maximum of 0.015 inch (0.381 mm) depth	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357
Round bottomed dents	All quantities less than 0.020 inch (0.508 mm) maximum depth and 0.100 inch (2.540 mm) maximum diameter.	See the repair	Refer to Section 72-53-07, Repair-06 in the PW4000 Series CIR, PN 51A357

Stage 3 Blade Inspection
Table 808 (Continued)

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
	One dent 0.030 inch (0.762 mm) depth maximum and 0.500 inch (12.700 mm) maximum diameter		
Loss of coat	No limit		
Burning and erosion	All quantities to a maximum of 0.020 inch (0.508 mm) depth and 0.300 inch (7.620 mm) maximum diameter	See the repair	Refer to Section 72−53−07, Repair−06 in the PW4000 Series CIR, PN 51A357

Stage 3 Blade Inspection
Table 808 (Continued)

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 General for: See Figure 809.			
Cracks	Not serviceable	Not repairable	Remove from service
Corrosion	Not serviceable	Remove the corrosion	Refer to Section 72-53-00, Cleaning-01 in the PW4000 Series CIR, PN 51A357
Nicks, dents, scratches, scoring and pitting	0.004 inch (0.102 mm) maximum depth	0.008 inch (0.203 mm) maximum depth. Damage is not permitted on the same area on the opposite side of the part.	Refer to Section 72-53-38, Repair-02 in the PW4000 Series CIR, PN 51A357
2 Knife-edges for surface damage and bending	Bending to a maximum of 0.015 inch (0.381 mm) from normal position with no other damage	Blends are permitted in the area as follows:	
		0.300 sq-in (194. sq-mm) is the maximum total blend area for the four knife-edge configuration	Refer to Section 72-53-38, Repair-01 in the PW4000 Series CIR, PN 51A357
		0.150 sq-in (97. sq-mm) is the maximum total blend	Refer to Section 72-53-38, Repair-06 in

Inner Rotating Airseal Visual Inspection
Table 809

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

	(CONTINUED)			
R			area for the two knife−edge configuration	the PW4000 Series CIR, PN 51A357

R Inner Rotating Airseal Visual Inspection
R Table 809 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
1 Areas of Stage 3 inner sealing ring assembly that you can access (other than in the areas of honeycomb) for: See Figure 810.			
Nicks and dents	0.005 inch (0.127 mm) depth	Not repairable	Remove from service
Radial and axial cracks	Not permitted	A maximum of 100 percent of the axial length of the part	Refer to Section 72-53-19, Repair-03 in the PW4000 Series CIR, PN 51A357
Circumferential cracks	Not permitted	Not repairable	Remove from service
2 Honeycomb area for:			
Damaged and bent cells (Other than in areas of the blade knife-edge contact)	Maximum damage size is 3 rows width by 0.800 inch (20.320 mm) length. Maximum of 5 damaged areas	Replace the honeycomb	Refer to Section 72-53-19, Repair-02 in the PW4000 Series CIR, PN 51A357

Inner Stage 3 Sealing Ring Visual Inspection
Table 810

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 3 disk (If airseal is removed) for: See Figure 811 (Sheet 1).			
Area A Fretting, galling, wear, scattered dents, nicks and scratches	0.003 inch (0.076 mm) maximum depth	0.003 − 0.015 inch (0.08 − 0.38 mm) maximum depth	Refer to Section 72−53−13, Repair−01 in the PW4000 Series CIR, PN 51A357
Stage 4 disk Area B Fretting, galling, wear, scattered dents, nicks and scratches	0.003 inch (0.076 mm) maximum depth	0.003 − 0.015 inch (0.08 − 0.38 mm) maximum depth	Refer to Section 72−53−14, Repair−01 in the PW4000 Series CIR, PN 51A357
Area C Fretting and galling	0.001 inch (0.025 mm) maximum depth	0.003 inch (0.076 mm) maximum depth to a maximum of 20 percent of the surface area	Refer to Section 72−53−14, Repair−01 in the PW4000 Series CIR, PN 51A357
		A maximum of 0.010 inch (0.254 mm) depth A maximum of 10 percent of the surface area.	
Stage 5 rear turbine hub. See Figure 811 (Sheet 2).			

R Stages 3, 4, 5 And 6 Disks Visual Inspection
R Table 811

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area D Fretting, galling, wear, scattered dents, nicks and scratches	0.003 inch (0.076 mm) maximum depth	0.003 - 0.015 inch (0.08 - 0.38 mm) maximum depth	Refer to Section 72-53-15, Repair-01 in the PW4000 Series CIR, PN 51A357
If turbine exhaust case removed Stage 6 disk for:			
Area E Fretting, galling, wear, scattered dents, nicks and scratches	0.003 inch (0.076 mm) maximum depth	0.003 - 0.015 inch (0.08 - 0.38 mm) in depth	Refer to Section 72-53-16, Repair-02 in the PW4000 Series CIR, PN 51A357
Area F Fretting and galling	Not permitted	0.003 inch (0.076 mm) maximum depth to a maximum of 20 percent of the surface area	Refer to Section 72-53-16, Repair-02 in the PW4000 Series CIR, PN 51A357
		A maximum of 0.010 inch (0.254 mm) depth A maximum of 10 percent of the surface area	

R Stages 3, 4, 5 And 6 Disks Visual Inspection
R Table 811 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area G			
Fretting, galling, wear, scattered dents, nicks and scratches	Not permitted	0.015 inch (0.381 mm) maximum depth	Refer to Section 72−53−16, Repair−02 in the PW4000 Series CIR, PN 51A357

Stages 3, 4, 5 And 6 Disks Visual Inspection
Table 811 (Continued)

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 6 LPT blade for: See Figure 812			
Cracks in all areas	Not permitted	No limit	Replace the blade
Area A Nicks and dents	Not permitted	No limit	Refer to Section 72-53-10, Repair-05 in the PW4000 Series CIR, PN 51A357
Area B Nicks and dents	All quantities to a maximum of 0.015 inch (0.381 mm) depth and 0.030 inch (0.762 mm) diameter metal displacement maximum	No limit	Refer to Section 72-53-10, Repair-05 in the PW4000 Series CIR, PN 51A357
Area C Nicks and dents	Not permitted	No limit	Refer to Section 72-53-10, Repair-05 in the PW4000 Series CIR, PN 51A357
Area D Nicks and dents	All quantities to a maximum of 0.020 inch (0.508 mm) depth	No limit	Refer to Section 72-53-10, Repair-05 in the PW4000 Series CIR, PN 51A357

Stage 6 Blade Surface Damage Inspection
Table 812

R ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - INSPECTION/CHECK-10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Stage 6 LPT vane airfoil for: See Figure 813.			
Cracks in all areas	Not permitted	No limit	Replace the vane
Area A Dents and nicks	Not permitted	No limit	Refer to Section 72-53-26, Repair-01 in the PW4000 Series CIR, PN 51A357
Area B Nicks and dents	All quantities to a maximum of 0.015 inch (0.381 mm) depth. 0.030 inch (0.762 mm) diameter maximum metal displacement with no cracking.	No limit	Refer to Section 72-53-26, Repair-01 in the PW4000 Series CIR, PN 51A357
Area C Nicks and dents	Not permitted	No limit	Refer to Section 72-53-26, Repair-01 in the PW4000 Series CIR, PN 51A357

R Stage 6 Vane Airfoil Surface Inspection
R Table 813

R ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − INSPECTION/CHECK−10

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area D			
Nicks and dents	All quantities to a maximum of 0.020 inch (0.508 mm) depth	No limit	Refer to Section 72−53−26, Repair−01 in the PW4000 Series CIR, PN 51A357

NOTE: Only one airfoil side, shrouds and trailing edge are seen. If you see damage on the side of the vane, a full inspection of the vane must be done. Use boroscope, mirrors or other necessary tooling to see the vane leading edge and remainder of the airfoil surfaces.

Stage 6 Vane Airfoil Surface Inspection
Table 813 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
	CAUTION: ALL INDICATIONS MUST BE EXAMINED BY NON-DESTRUCTIVE INSPECTION PROCEDURE. IF THE INDICATION IS A CRACK, THE SHAFT IS NOT REPAIRABLE AND MUST BE REMOVED FROM SERVICE.		
1	0.050 inch (1.270 mm) reference		
Area A for: See Figure 814. Scratches, nicks, chips and missing coat	Not permitted	No limit	Restore the coat. Refer to Section 72-53-80, Repair-03 in the PW4000 Series CIR, PN 51A357 Touch up the coat. Refer to Section 72-53-80, Repair-15 in the PW4000 Series CIR, PN 51A357
		Surface damage into the base metal to a maximum of 0.010 inch (0.254 mm) depth	Blend repair. Refer to Section 72-53-80, Repair-02 in the PW4000 Series CIR, PN 51A357
Corrosion and pitting	Not permitted	Shafts with indication of corrosion must be stripped and repair by Repair-29	Refer to Section 72-53-80, Repair-29 in the PW4000 Series CIR, PN 51A357

LPT Shaft Surface Inspection
Table 814

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area B Front outer diameter fillet radius for pitting	Not permitted	A maximum of 0.027 inch (0.686 mm) depth	Refer to Section 72-53-80, Repair-02 in the PW4000 Series CIR, PN 51A357
Area C Front outer diameter for pitting	Not permitted	See the repair	Refer to Section 72-53-80, Repair-29 in the PW4000 Series CIR, PN 51A357
Area D Front (66 tooth) Spline for:			
Pitting on the spline face surfaces	All quantities to a maximum of 0.003 inch (0.076 mm) depth on the loaded surface		
	All quantities to a maximum of 0.005 inch (0.127 mm) depth on the not loaded surface		
Pitting in the spline root radius	All quantities to a maximum of 0.001 inch (0.025 mm) depth on the rear 1.000 inch (25.400 mm) of the spline root radius		

LPT Shaft Surface Inspection
Table 814 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)			
	All quantities to a maximum of 0.002 inch (0.051 mm) depth on the remainder of the spline root radius		
Rough edges and raised material	Not permitted	See the repair	Refer to Section 72-53-80, Repair-02 in the PW4000 Series CIR, PN 51A357
Area E			
Bolt flange and mating part surfaces for galling, pitting and scoring	Not permitted	0.015 inch (0.381 mm) maximum depth for 15 percent of the area maximum. See repair applicable to damage.	Refer to Section 72-53-80, Repair-02, Repair-05, Repair-06, Repair-07, Repair-08, Repair-09, Repair-13 and Repair-15 in the PW4000 Series CIR, PN 51A357
Area F			
Threads for galling, pitting, scoring and raised material	Not permitted	6.000 inches (152.400 mm) total length of the thread can be repaired	
		2.000 inches (50.800 mm) maximum thread removal at all locations	

LPT Shaft Surface Inspection
Table 814 (Continued)

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
(CONTINUED)		2.500 inches (63.500 mm) minimum not damaged thread between the two damaged or removed sections of the thread. See the notes.	

NOTE: All the length measurements are along the outer diameter circumference of the thread.

NOTE: You can remove the damaged threads for the full length or pitch of the thread (hold to a minimum) and to a depth necessary to clean up the damaged threads (hold to a minimum).

Examine	Serviceable Limits	Repairable Limits	Disposition/ Repair
Area G Mating diameter and shoulder face	Not permitted	See the repair	Refer to Section 72−53−80, Repair−14 in the PW4000 Series CIR, PN 51A357

R (Task 72-00-53-210-010)

ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) - REPAIR-01

Task 72-00-53-300-001:

1. Stop Drill Repair Turbine Case Front Inner Rail Cracks

NOTE: This repair can be used to repair radial cracks in the smooth section and slots of the turbine case front inner rail with a radial length of 0.300 - 0.425 inch (7.6 - 10.8 mm).

NOTE: Optional, you can stop drill repair cracks in the front inner rail after the low pressure turbine is disassembled. Refer to 72-53-17, Repair-23 Task 72-53-17-300-023.

A. Prerequisites

(1) Remove the low pressure turbine from the engine. Refer
R to 72-00-53, Removal-01 (Task 72-00-53-020-001),
R Removal-02 (Task 72-00-53-020-001-002), or remove the low pressure turbine and the turbine exhaust case from the engine. Refer to 72-00-53, Removal-08 (Task 72-00-53-020-002-001) or Removal-09 (Task 72-00-53-020-002-002).

B. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P05-212	Wire, Welding (AMS 5679)
P05-151	Wire, Welding (AMS 5837)
P05-213	Wire (AMS 5687)

C. Procedure

See Figure 901 and Figure 902.

Subtask 72-00-53-350-051:

(1) Locate any 0.058 - 0.068 inch (1.47 - 1.73 mm) diameter stop drill holes that were not plugged. These holes must be re-operated as specified in the following procedure.

CAUTION: WEAR EYE PROTECTION WHEN YOU GRIND THE HARDFACE.

CAUTION: HARDFACE COATING CAN CHIP IF THE FOLLOWING GRINDING PROCEDURE IS NOT USED

(2) Grind to remove all of the hardface from Area X. See Figure 902 (Sheet 1). Use a manually guided rotating abrasive wheel. Keep parent metal removal to a minimum.

NOTE: All stop drill holes must be at the same radial location as the cooling air holes.

Subtask 72-00-53-350-052:

CAUTION: THE TURBINE CASE CAN BE SLIGHTLY OUT OF ROUND. LOCATE THE CENTER OF THE STOP DRILL HOLES 0.091 - 0.121 INCH (2.31 - 3.07 mm) INWARD FROM THE ID OF THE TURBINE CASE WALL AS SPECIFIED IN FIGURE 901 (SHEET 2).

(3) Drill a 0.085 - 0.095 inch (2.16 - 2.41 mm) diameter hole radially in line with the crack. Maintain at least 0.200 inch (50.80 mm) distance from an existing cooling air hole. See Figure 901.

NOTE: If the projected radial growth of a crack does not intersect an existing cooling air hole, but is within 0.200 inch (50.80 mm) of an existing cooling air hole, a stop drill hole must be installed as close as possible to the existing cooling air hole. See Figure 901 (Sheet 1).

Subtask 72-00-53-350-053:

(4) Cut a pin of 0.084 inch (2.134 mm) diameter Wire P05-213 to a length of 0.450 - 0.500 inch (11.43 - 12.70 mm).

(5) Lightly peen to slightly ovalize one end of the wire to approximately 0.095 - 0.100 inch (2.413 - 2.540 mm).

NOTE: Ovalizing one end of the wire will help in installing the wire by providing an interference fit between the wire pin and the hole to be plugged.

(6) In the following step, you can not tack weld near a crack that is stop drilled. Plug and tack weld the cooling hole closest to the stop drilled hole. After you plug one cooling hole for each stop drilled hole a total of (43) 0.085 - 0.095 inch (2.16 - 2.41 mm) diameter holes must remain open.

CAUTION: DO NOT FORCE THE WIRE PIN INTO THE HOLE WITH EXCESSIVE FORCE OR YOU CAN PUSH THE PIN INTO THE NEXT COMPARTMENT.

(7) Install the end of the wire pin that is not deformed into the hole to be plugged, from the front side of the case rail. Use a drift or punch to install the wire pin flush with the blended surface on the front side of the case rail.

Subtask 72-00-53-310-004:

R (8) Tack weld the wire pin. Refer to PWA 16 (Task
R 70-42-01-310-004). Use Welding Wire P05-151 or P05-212. See 70-42-03, Standard Practices Manual. Tack weld only in the area shown in Figure 902 (Sheet 2).

NOTE: Stress-relief is not required.

Subtask 72-00-53-350-054:

CAUTION: IF GRINDING OF THE TACK WELD IS REQUIRED, DO DO NOT REMOVE ALL OF THE TACK WELD. MAKE SURE THAT THE WIRE PIN IS PROPERLY HELD IN THE HOLE AFTER ANY GRINDING OF THE TACK WELD IS PERFORMED.

(9) Grind the tack weld as required to make sure that the height of the weld is flush with or below the hardface surface.

NOTE: You do not have to replace the hardface in the in the repaired area.

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT) − REPAIR−02

Task 72−00−53−300−002:

1. In Situ Featherseal Replacement For Assembled LPT Module − 3rd Stage LPT Outer Transition Duct Assembly

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P05−151	Wire, Welding (AMS 5837)

Repair Details

PART NAME	QUANTITY	PARTS CATALOGUE REFERENCE SECTION/FIGURE/ITEM
Seal	AR	72−53−00/3/160

B. Procedure
See Figure 901.

Subtask 72−00−53−110−041−001:

(1) Clean the repair area by SPOP 209. Refer to the Standard Practices Manual, PN 585005, Section 70−21−00.

Subtask 72−00−53−300−001:

(2) Locally blend to remove the coating approximately 0.100 inch (2.540 mm) around the end of the slot to allow reweld after repair.

(3) Locally rout to open the end of the featherseal slot on the two adjacent outer transition ducts.

(a) Use a hand blending tool with a small burr to open the end of the featherseal slot enough to expose the damaged featherseal inside or a missing seal, and allow a new featherseal to be installed.

(b) Remove the damaged featherseal, as necessary.

(c) Install the replacement featherseal (PN 50N551 Typical).

1 It is permissible to shorten the replacement seal by 0.250 inch (6.350 mm) maximum, to prevent welding the seal to the duct.

Subtask 72−00−53−110−040−001:

(4) Wipe the weld area before welding by SPOP 208. Refer to the Standard Practices Manual, PN 585005, Section 70−21−00.

Subtask 72−00−53−310−004−001:

CAUTION: DO NOT WELD THE FETHERSEAL. PUSH THE FEATHERSEAL TO THE REAR OF THE SLOT TO KEEP IT FROM BEING WELDED.

(5) Weld the routed end of the featherseal slot by fusion welding (manual gas tungsten−arc) by PWA 16. See Standard Practices Manual, PN 585005, Section 70−42−01. Use Welding Wire P05−151. Use minimum weld bead necessary to trap the featherseal in the slot.

NOTE: It is not necessary to fill the entire routed end of the featherseal slot.

Subtask 72−00−53−220−062:

(6) Visually examine the repair area as follows.

(a) No cracks are permitted.

(b) It is permissible to have no coating or incomplete coating in 0.500 inch (12.700 mm) of the repair area.

(c) The featherseal must not be welded.

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-01

Task 72-00-54-020-001:

1. Remove Turbine Exhaust Case

NOTE: See Figure 301 for part/assembly removal sequence.

A. Equipment And Materials Required

Standard Tools:
.190-32 Jackscrews, Eight Necessary By Text

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 25758	Pedestal
PWA 26157	Pedestal, Engine Support (Optional To PWA 87359)
PWA 28374	Guide
PWA 28657	Sling, Strongback
PWA 29389	Pump, Hydraulic
PWA 75284	Puller, Knocker
PWA 75995	Support
PWA 76154	Adapter (2 Necessary)
PWA 85062	Saddle, Support
PWA 85305	Pins, Aligning (2 Necessary)
PWA 85307	Puller, Jackscrew
PWA 85431	Puller Hydraulic
PWA 85432	Puller, Hydraulic
PWA 85434	Puller, Jackscrew (Optional To PWA 87053)
PWA 85452	Eye, Lifting (Optional To PWA 28657)
PWA 85583	Fixture, Support
PWA 85850	Guide
PWA 86438	Adapter
PWA 87053	Puller, Jackscrew
PWA 87359	Pedestal, Engine Support
PWA 102178	Support, Rear (Optional To PWA 75995 And PWA 85696)

B. Procedure

(1) Disconnect/remove nacelle parts for access to turbine exhaust case per 71-00-54, Removal-01 (Task 71-00-54-020-XXX).

(2) Disconnect/remove external parts for access to exhaust case per Removal-02 (Task 72-00-54-020-003).

(3) Install PWA 85062 Saddle to PWA 87359 or PWA 26157 Pedestal (adjustable). Secure saddle to pedestal with ball-lock pin. See Figure 302.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−01

(4) Position saddle and pedestal under diffuser case at 6 o'clock location just forward of Flange M.

(5) Attach PWA 28657 Sling, two PWA 76154 Adapters and hoist to spools on exhaust case at 3 and 9 o'clock.

NOTE: See following step for optional procedure using lifting eye for handling turbine exhaust case.

(6) If applicable, position PWA 85452 Lifting Eye to turbine exhaust case. Align attachment block details to bushing holes in case rails at 2 and 10 o'clock. Install pins through bushings and blocks. Secure pins with safety clips. See Figure 302.

(7) Adjust pedestal at diffuser case, 6 o'clock location, to support engine.

(8) Raise rear of engine and remove two pedestals from exhaust case location; then lower engine to level position, resting on pedestal at diffuser case. Do not remove sling or eye.

(9) If not previously accomplished, remove bolts (303/6) securing No. 4 bearing shield (303/5) to turbine exhaust case (rear inner flange) (303/1). Remove shield. Remove No. 4 bearing heat shield (303/4). See Figure 303.

(10) If not previously accomplished remove No. 4 bearing cover (303/3).

(a) For No. 4 bearing cover (303/3) that has six small threaded holes (Pre SB PW4ENG 72−385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing (303/2).

(b) For cover that has eight jackscrew holes (Post SB PW4ENG 72−385), install and evenly tighten eight 0.190−32 Jackscrews to remove the cover. Discard the packing (303/2).

(11) Remove No. 4 bearing scavenge tube (inner) (304/6). See Figure 304.

(a) Remove key washer (304/5) and bolt (304/4) securing No. 4 bearing oil scavenge (inner) tube (304/6), bracket, to exhaust case inner flange at 6 o'clock position.

(b) Remove key washers (304/2) and bolts (304/3) securing No. 4 bearing oil scavenge tube (304/6) to exhaust case inner flange at 7:30 o'clock location. Remove scavenge tube. Discard packing (304/1).

(12) Remove No. 4 bearing retaining plate (304/8).

(a) Remove bolts (304/10) and key washers (304/9) securing retaining plate to front compressor drive turbine shaft (304/11). Discard key washers.

CAUTION: USE CARE WHEN ACTUATING PULLER PWA 75284. DAMAGE TO EXHAUST CASE MAY RESULT BY SUDDEN REARWARD MOVEMENT OF PULLER WHEN NO. 4 BEARING RETAINING PLATE IS RELEASED FROM ENGINE.

(b) Rotate knurled nut detail of PWA 75284 Knocker Puller to retract jaws. Install puller onto retaining plate with jaws in line with slots in retaining plate wall. Tighten knurled nut to secure jaws in retaining plate. Using slide hammer, remove retaining plate from shaft. Remove puller.

(c) Discard packing (304/2).

(13) For removing exhaust case assembly using PWA 75995 Support and PWA 86438 Adapter, proceed as follows: See Figure 305.

NOTE: See following step for removing exhaust case assembly using optional PWA 102178 Support.

(a) Align boltholes and insert PWA 75995 Support through turbine exhaust case and into ID of front compressor drive turbine shaft (305/6). Secure support flange to turbine shaft with eight screws (305/5).

(b) Slide PWA 28374 Guide larger diameter first over PWA 75995 Support and seat against bearing inner race.

(c) Align boltholes and slide hub PWA 86438 Adapter hub forward into inner flange of turbine exhaust case. Secure flange to case with screws (305/2).

(d) Position PWA 25758 Pedestal under spool of PWA 75995 Support and adjust accordingly.

(14) For removing exhaust case assembly using PWA 102178 Support, proceed as follows: See Figure 305.

(a) Align boltholes and insert shaft (305/3) through turbine exhaust case and into ID of front compressor drive turbine shaft (305/6). Secure shaft flange to turbine shaft with eight screws (305/1).

(b) Slide PWA 85850 Guide, larger diameter first, over PWA 102178 Support and seat against bearing inner race.

(c) Align boltholes and slide hub (305/4) forward into inner flange of turbine exhaust case. Secure hub flange to case with five screws (305/2).

(15) Position 12 to 16 brass shims equally spaced over 90 − 100 degree arc. Place shims just to rear of knife−edge seal between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(16) Adjust sling and hoist attached to spools on exhaust case to support case when separating it from low pressure turbine.

(17) Remove Flange P bolts, nuts and brackets securing turbine exhaust case to turbine case. Refer to 72−00−54 Removal−20 (Task 72−00−54−020−005).

(18) Install two PWA 85306 Aligning Pins, 180 degrees apart, in Flange P.

(a) Locate smaller .190−32 threaded bolthole in exhaust case and secure plate to rear of exhaust case using detail screw.

(b) Insert two aligning pins through boltholes in turbine case flange and thread into tapped holes in plate.

(19) Using twelve 0.190-32 jackscrews, remove turbine exhaust case from snap diameter of low pressure turbine case.

(20) Move turbine exhaust case rearward approximately 12 inches (306.8 mm).

(21) Install PWA 85583 Fixture to rear flange of turbine rear case. See Figure 306.

(a) Center flange segment (306/5) to rear flange of turbine rear case (306/7) at 12 o'clock location. Secure flange segment to case with six bolts (306/6).

(b) Loosen two jamnuts (306/4). Adjust nut (306/1) to support ID of 6th stage LPT disk (306/3) to maintain proper positioning of low pressure turbine rotor.

(22) If installed, remove PWA 25748 Pedestal from PWA 75995 Support.

(23) Slide turbine exhaust case rearward off of the support.

(24) Remove the adapter or hub detail from the exhaust case rear inner flange.

CAUTION: WHEN REMOVING TURBINE EXHAUST CASE AND POSITIONING IT ONTO PALLET, CARE MUST BE TAKEN NOT TO DAMAGE FRONT END SEAL RING.

(25) Provide suitable support on pallet to protect front end seal. Lower turbine exhaust case, rear end down, onto pallet.

(26) Remove adapters, sling and two brackets at 3 and 9 o'clock locations on turbine exhaust case. Remove alignment pins from turbine rear case flange.

(27) Remove tool details from the turbine rear shaft.

CAUTION: MAKE SURE THAT NO. 4 BEARING INNER AND OUTER RACES ARE KEPT TOGETHER.

(28) Remove No. 4 bearing (rear) seal spacer (307/5) and inner race (308/6) from front compressor drive turbine shaft (307/1) using PWA 85431 Puller. See Figure 307.

(a) Remove jaw retaining ring from puller and slide three jaws outward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner locating ring to turbine shaft with three detail screws.

(c) Slide three jaws inward behind puller lip of No. 4 bearing (rear) seal spacer (307/5). Install retaining ring over jaws and seat on lugs of jaws.

(d) Attach PWA 29389 or PWA 3755 Hydraulic Pump to hydraulic cylinder on puller.

(e) Actuate pump to remove inner race and spacer from turbine shaft.

(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.

(g) Remove bearing inner race and spacer from turbine shaft and store parts in suitable container.

(29) Remove No. 4 bearing (front) seal spacer (307/3) and No. 4 bearing (carbon) face seal (307/4) using PWA 85434 or PWA 87053 Puller.

(a) Rotate outer plate to centralize three puller legs between arms of inner plate. Slide three puller legs inward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner plate to turbine shaft with three detail screws.

(c) Slide three puller legs outward to engage puller lip in ID of No. 4 bearing seal spacer. It may be necessary to turn jackscrew to align puller lip on jaws with puller groove in spacer. Rotate outer plate detail to align puller legs with three arms of inner plate detail to secure puller.

(d) Turn center jackscrew to remove seal and spacer.

(e) Rotate outer plate to centralize three puller legs between arms of inner plate. Loosen screws and slide jaws inward. Remove screws securing inner plate to turbine shaft and remove puller from shaft.

(f) Remove (carbon) face seal and seal spacer from turbine shaft and store parts in suitable containers.

(30) Remove 6th stage LPT airseal (307/2) from LPT (rear hub) (307/1) using PWA 85432 Puller.

(a) Remove jaw retaining ring from puller and slide four jaws outward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner locating ring to turbine shaft with two detail screws.

(c) Slide four jaws inward, engaging puller legs in four holes in side of airseal. Install retaining ring over jaws and seal on lugs of jaws.

(d) Attach PWA 29389 or PWA 3755 Hydraulic Pump to hydraulic cylinder on puller.

(e) Actuate pump to remove airseal from turbine shaft.

(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.

(g) Remove airseal from turbine shaft and store in suitable container.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−01

Task 72-00-54-020-003:

1. Remove External Plumbing Prior To Turbine Exhaust Case Removal

A. Equipment And Materials Required - None

B. Procedure
See Figures 301, 302, 303, 304 and 305.

(1) (Pre SB PW4ENG 79-76) Remove No. 4 bearing oil pressure tube assembly (LP16) as follows. See Figure 301.

(a) Remove the clamps securing spray shield to front tube connection and if equipped a bracket, forward of Flange M at approximately 10 o'clock position. Remove the shield from the engine. Remove lockwire and disconnect tube nut from coupling.

(b) Remove hose clamp securing spray shield to rear tube connection on exhaust case at approximately 10:30 o'clock position. Remove shield from engine. Remove lockwire and disconnect tube nut from strainer housing.

(c) Remove bolts, spacer, nuts, and clamps securing tube to brackets and adjacent scavenge tube. Remove tube from engine.

(d) Remove lockwire and No. 4 bearing strainer element from strainer housing. Discard packing.

(e) Remove lockwire and disconnect strainer housing from exhaust case internal tube nut at approximately 10:30 o'clock position.

(f) Install protective closures.

(2) (Post SB PW4ENG 79-76) Remove No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. See Figure 305.

(a) Remove clamps and the tube spray shields at the (LP48) tube to the strainer housing connection, at the (LP47) tube to the (LP48) tube connection and at the (LP47) tube to the (LP15) tube connection. See Views G, CA and LA.

(b) Remove clamps, bolts and nuts as shown in Views M, N, B1, P, R and F.

(c) Remove the (LP48) tube from the strainer housing and the (LP47) tube. See Views G and CA.

(d) Remove the element housing from the tube nut at approximately the 7 o'clock position. See View G.

(e) Remove the No. 4 bearing strainer element from the element housing. See View G.

(f) Remove and discard packing from the groove in the strainer element. See View G.

(g) Remove bolts and clamps. See Views U, T, and S.

(h) Remove the coupling nut that attaches (LP15) tube to the (LP47) tube. See View LA.

(3) (Pre SB PW4ENG 79-76) Remove No. 3 bearing oil vent tube assembly (LD02) as follows. See Figure 301.

(a) Remove lockwire and disconnect tube coupling from tube nut forward of Flange N at approximately 8 o'clock position.

(b) Remove lockwire and disconnect tube nut from adapter on exhaust case at approximately 7 o'clock position.

(c) Between Flanges N and P, remove the bolt, nut, and clamp that secures the tube to the adjacent PT4.95 tube assembly.

(d) Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that secures the tube to the adjacent PT4.95 tube assembly (Post SB PW4ENG 72-134).

(e) Remove bolts, nuts and clamps securing tube to Flanges N and P brackets. Remove tube from engine and install protective closures.

(4) (Pre SB PW4ENG 79-76) Remove the (rear) EEC PT4.95 pressure tube assembly (AS02) as follows. See Figure 301.

(a) Remove lockwire and disconnect tube nut from tee rearward of Flange P at approximately 6 o'clock position (Pre SB PW4ENG 72-134).

(b) Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position (Post SB PW4ENG 72−134).

(c) Remove bolt, nut, and clamp securing tube to Flange P bracket at approximately 7 o'clock position (Pre SB PW4ENG 72−134).

(d) Remove lockwire and disconnect tube nut from tube coupling rearward of Flange N at approximately 8 o'clock position. Remove tube from engine and install protective closures.

(5) (Post SB PW4ENG 79−76) Remove the (rear) No. 3 bearing oil vent tube assembly (LD02) and the (rear) EEC PT4.95 pressure tube assembly (AS02) as follows. See Figure 305.

(a) Remove clamps, nut and bolts from the (AS27) tube, the (LD02) tube, the (AS02) tube and the (LP48) tube. See Views H, I, J, K and L,

(b) Remove the bolt that attaches the (AS02) tube to the bracket. See View G.

(c) Remove the (AS02) tube from the (AS03) and (AS27) tubes. See (Sheet 1).

(d) Remove the (LD02) tube from the (LD01) tube and to the turbine exhaust case. See (Sheet 1).

(6) (Pre SB PW4ENG 79−75) Remove (rear) No. 4 bearing oil scavenge tube assembly (LR06) as follows. See Figure 301.

(a) Remove bolt, nut and clamp securing spray shield to Flange M bracket at approximately 7 o'clock position. Remove hose clamp from forward end of spray shield and remove shield from engine. Remove lockwire and disconnect tube nut from tube coupling.

(b) Remove lockwire and disconnect tube elbow from exhaust case internal tube nut at approximately 10 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flanges N and P brackets. Remove tube from engine and install protective closures.

(d) Remove bolts, nuts and clamp bracket attached to Flange N bracket at approximately 7 o'clock position.

(7) (Post SB PW4ENG 79−75 and Pre SB PW4ENG 79−76 only) Remove (rear) No. 4 bearing scavenge tube assembly (LR06) as follows. See Figure 301.

(a) Remove hose clamp securing the tube shield to the bracket inboard side of Flange M at approximately 7 o'clock position. Remove the lockwire and disconnect the (LR05) hose and tube assembly nut from the (LR06) tube coupling.

(b) Remove lockwire and disconnect tube elbow from exhaust case internal tube nut at approximately 10 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flanges N and P brackets. Remove tube from engine and install protective closures.

(d) Remove bolts, nuts and clamp bracket attached to Flanges M and N brackets at approximately 7 o'clock position.

(8) (Post SB PW4ENG 79−76) Remove (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows. See Figure 305.

(a) Remove clamps and the tube spray shields at the (LR21) tube to (LR22) tube connection and at the (LR05) tube to the (LR21) tube connection. See Views E and DE.

(b) Remove clamps on the (LR22). See Views A, B, C and D.

(c) Remove the (LR22) tube from the (LR21) tube and the port for the internal tube on the turbine exhaust case. See Views E and AP.

(d) Remove clamps, nuts and bolts that secure (LR21) tube. See Views F, O, Q and R.

(e) Remove the (LR21) tube from the (LR05) tube. See View DE.

(9) (Pre SB PW4ENG 79−75) Remove (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows. See Figure 302.

(a) Remove bolts, nuts and clamps securing tube to main oil filter tube at approximately 6 o'clock position.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters).

(b) Remove bolts securing tube to main oil pump and remove tube from engine.

(c) Remove and discard packing. Install protective closures.

(d) Remove the six loop clamp grommet halves (Post SB PW4ENG 79−46) from the tube.

(10) (Post SB PW4ENG 79−75) Remove (front) No. 4 bearing oil scavenge hose and tube assembly (LR05) as follows. See Figure 302.

(a) Remove the bolts, nuts and clamps that attach the hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or fluid pressure adapter.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters).

(b) Remove lockwire from the tube nut to the main oil pump connection. Remove bolts securing tube to main oil pump and remove tube from engine.

(c) Remove and discard packing. Install protective closures.

(d) Remove the bolts that secure the loop clamp bracket to the TCC manifold bridge bracket. Remove the loop clamp bracket.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(11) (Pre SB PW4ENG 79−75) Remove main filter oil tube assembly (LP01) as follows. See Figure 302.

NOTE: Ensure oil has been previously drained from main oil filter housing.

(a) Remove bolts securing tube to front of main oil filter housing.

(b) Remove bolts and bracket securing tube to top of main oil pump.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters) at lower end of tube.

(c) Remove bolt, nut and clamp securing tube to diffuser case bracket at approximately 7 o'clock position.

(d) Remove bolts, nuts and clamps securing tube to gearbox brackets at approximately 8 o'clock position and remove tube from engine.

(e) Remove the six (clip−on) loop clamp grommet halves from the tube (Post SB PW4ENG 79−36 only).

(f) Remove and discard packings. Install protective closures.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A

R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(12) (Post SB PW4ENG 79-75) Remove the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86) and the main oil filter hose and tube assembly (LP01) as follows. See Figure 302.

NOTE: Ensure oil has been previously drained from main oil filter housing.

(a) Remove bolts securing the hose and tube assembly to the front of the main oil filter housing.

(b) Remove bolts and bracket that hold the hose and tube assembly to the top of the fluid pressure dampener or adapter.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters) at lower end of tube.

(c) Remove bolt, nut and clamp securing tube to diffuser case bracket at approximately 7 o'clock position.

(d) Remove bolts, nuts and clamps securing tube to gearbox brackets at approximately 8 o'clock position and remove tube from engine.

(e) Remove the bolts and nuts that hold the loop clamp bracket to the fluid pressure dampener or adapter. Remove the bracket.

(f) Remove the bolts that hold the fluid pressure dampener or adapter to the top of the main oil pump. Remove the fluid pressure dampener or adapter from the main oil pump.

(g) Remove and discard packings. Install protective closures.

(13) Remove LPT case cooling (TCC) manifold assemblies (AC01) through (AC14) as follows. See Figure 303.

(a) Remove bolts securing all manifold ends (upper and lower) to manifold (collector).

(b) Remove the upper and lower cover assemblies from the rear (No. 7) of the manifold (collector) (Post SB PW4ENG 75-53).

(c) Remove bolts, nuts and bracket securing cooling air manifold support brackets to brackets at Flange N.

(d) Remove the bolts, nuts, spacers and clamps that attach the rear mounts of the cooling manifolds to brackets on Flange P (Pre SB PW4ENG 75-50).

(e) Remove the bolts, nuts and clamps that attach the rear mounts of the cooling manifolds to brackets on Flange P (Post SB PW4ENG 75-50).

(f) Rotate lower manifolds to disengage manifold (collector) and remove manifolds from engine.

(g) Rotate upper manifolds to disengage manifold (collector) and remove manifolds from engine. Install protective closures.

(14) Remove LPT case cooling manifold (collector) as follows.

(a) Remove bolts securing manifold (collector) to support bracket and LPT cooling valve flange.

(b) Remove bolts and clamps securing front bracket on manifold (collector) to Flange N bracket.

(c) Remove bolts and nuts securing rear of manifold (collector) to Flange P brackets.

(d) Remove manifold (collector) and install protective closures.

(15) Remove (lower right) turbine cooling tube assembly (AP02) as follows. See Figure 304.

(a) Remove lockwire, bolts and bracket securing cooling tube rear flange to HPT case at approximately 4 o'clock position.

(b) Remove bolts and nuts securing cooling tube front flange to air shutoff valve on HPC case.

(c) Remove bolts, nuts and clamp securing tube to Flange M bracket and remove tube from engine.

(d) Remove and discard the gaskets. Install protective closures.

(16) Remove (lower right) turbine blade cooling tube assembly (AP37) as follows.

(a) Remove lockwire, bolts and bracket securing tube flange to diffuser case at approximately 5 o'clock position.

(b) Remove bolt, nut, and clamp securing fuel manifold to bracket. Remove bracket.

(c) Remove bolts and bracket securing tube flange to air shutoff valve on HPC case.

(d) Remove bolts, nuts and clamps securing tube to diffuser case brackets.

(e) (Pre SB PW4ENG 72-572 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(f) (Post PW4ENG 72-572 and Pre SB PW4ENG 72-627 or Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

(17) Remove (lower front) turbine case cooling (TCC) HPT manifold assembly (AC25) as follows.

(a) Remove bolt securing manifold end to HPT manifold (collector).

(b) Remove bolts and nuts securing manifold clamps to brackets attached to Flange M brackets at approximately 4, 7 and 9 o'clock positions.

(c) Remove bolts and nuts securing manifold loop clamp brackets to Flange M brackets at approximately 4, 7 and 9 o'clock positions.

(d) Rotate and lower manifold to disengage collector and remove from engine. Install protective closures.

External Plumbing Clipping Views (Post SB PW4ENG 79-76)
Figure 305 (Sheet 11)
(Task 72-00-54-020-003)

Task 72−00−54−020−004:

1. Remove External Plumbing Prior To Turbine Exhaust Case Removal

A. Equipment And Materials Required − None

B. Procedure
See Figure 301, Figure 302, Figure 303, Figure 304 and Figure 305.

(1) (Pre SB PW4ENG 79−76) Remove No. 4 bearing oil pressure tube assembly (LP16) as follows. See Figure 301.

(a) Remove the clamps that attach the spray shield to the front tube connection and bracket, forward of Flange M at approximately the 10 o'clock position. Remove the shield from the engine. Remove lockwire and disconnect the tube nut from the coupling.

(b) Remove the hose clamp that attaches the spray shield to the rear tube connection on the exhaust case at approximately the 10:30 o'clock position. Remove the shield from the engine. Remove lockwire and disconnect the tube nut from the strainer housing.

(c) Remove the bolts, spacer, nuts, and clamps that attach the tube to the brackets and adjacent scavenge tube. Remove the tube from the engine.

(d) Remove the lockwire and the No. 4 bearing strainer element from the strainer housing. Discard the packing.

(e) Remove the lockwire and disconnect the strainer housing from the exhaust case internal tube nut at approximately the 10:30 o'clock position.

(f) Install protective closures.

(2) (Post SB PW4ENG 79−76) Remove No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. See Figure 305.

(a) Remove clamps and the tube spray shields at the (LP48) tube to the strainer housing connection, at the (LP47) tube to the (LP48) tube connection and at the (LP47) tube to the (LP15) tube connection. See Views G, CA and LA.

(b) Remove clamps, bolts and nuts as shown in Views M, N, B1, P, R and F.

(c) Remove the (LP48) tube from the strainer housing and the (LP47) tube. See Views G and CA.

(d) Remove the element housing from the tube nut at approximately the 7 o'clock position. See View G.

(e) Remove the No. 4 bearing strainer element from the element housing. See View G.

(f) Remove and discard packing from the groove in the strainer element. See View G.

(g) Remove bolts and clamps. See Views U, T, and S.

(h) Remove the coupling nut that attaches (LP15) tube to the (LP47) tube. See View LA.

(3) (Pre SB PW4ENG 79−76) Remove No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Remove the lockwire and disconnect the tube coupling from the tube nut forward of Flange N at approximately the 8 o'clock position.

(b) Remove the lockwire and disconnect the tube nut from the adapter on the exhaust case at approximately the 7 o'clock position.

(c) Between Flanges N and P, remove the bolt, nut, and clamp that attaches the tube to the adjacent PT4.95 tube assembly.

(d) Remove the bolt, nut, and clamp at approximately the 7:30 o'clock position on the exhaust case that attaches the tube to the adjacent PT4.95 tube assembly.

(e) Remove the bolts, nuts and clamps that attach the tube to the Flanges N and P brackets. Remove the tube from the engine and install protective closures.

(4) (Pre SB PW4ENG 79-76) Remove the (rear) EEC PT4.95 tube assembly (AS02) as follows.

(a) Remove the lockwire and disconnect the tube nut from the tube coupling at the rear of Flange P at approximately the 7 o'clock position.

(b) Remove the lockwire and disconnect the tube nut from the tube coupling rearward of Flange N at approximately the 8 o'clock position. Remove the tube from the engine and install protective closures.

(5) (Post SB PW4ENG 79-76) Remove the (rear) No. 3 bearing oil vent tube assembly (LD02) and the (rear) EEC PT4.95 pressure tube assembly (AS02) as follows. See Figure 305.

(a) Remove clamps, nut and bolts from the (AS27) tube, the (LD02) tube, the (AS02) tube and the (LP48) tube. See Views H, I, J, K and L,

(b) Remove the bolt that attaches the (AS02) tube to the bracket. See View G.

(c) Remove the (AS02) tube from the (AS03) and (AS27) tubes. See (Sheet 1).

(d) Remove the (LD02) tube from the (LD01) tube and to the turbine exhaust case. See (Sheet 1).

(6) (Pre SB PW4ENG 79-75) Remove the (rear) No. 4 bearing oil scavenge tube assembly (LR06) as follows. See Figure 301.

(a) Remove the bolt, nut and clamp that attaches the spray shield to the Flange M bracket at approximately the 7 o'clock position. Remove the hose clamp from the forward end of the spray shield and remove the shield from the engine. Remove the lockwire and disconnect the tube nut from the tube coupling.

(b) Remove the lockwire and disconnect the tube elbow from the exhaust case internal tube nut at approximately the 10 o'clock position.

(c) Remove the bolts, nuts and clamps that attach the tube to the Flanges N and P brackets. Remove the tube from the engine and install protective closures.

(d) Remove the bolts, nuts and clamp bracket attached to the Flange N bracket at approximately the 7 o'clock position.

(7) (Post SB PW4ENG 79-75 and Pre SB PW4ENG 79-76 only) Remove (rear) No. 4 bearing scavenge tube assembly (LR06) as follows. See Figure 301.

(a) Remove hose clamp securing the tube shield to the bracket inboard side of Flange M at approximately 7 o'clock position. Remove the lockwire and disconnect the (LR05) hose and tube assembly nut from the (LR06) tube coupling.

(b) Remove lockwire and disconnect tube elbow from exhaust case internal tube nut at approximately 10 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to Flanges N and P brackets. Remove tube from engine and install protective closures.

(d) Remove bolts, nuts and clamp bracket attached to Flanges M and N brackets at approximately 7 o'clock position.

(8) (Post SB PW4ENG 79-76) Remove (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows. See Figure 305.

(a) Remove clamps and the tube spray shields at the (LR21) tube to (LR22) tube connection and at the (LR05) tube to the (LR21) tube connection. See Views E and DE.

(b) Remove clamps on the (LR22). See Views A, B, C and D.

(c) Remove the (LR22) tube from the (LR21) tube and the port for the internal tube on the turbine exhaust case. See Views E and AP.

(d) Remove clamps, nuts and bolts that secure (LR21) tube. See Views F, O, Q and R.

(e) Remove the (LR21) tube from the (LR05) tube. See View DE.

(9) (Pre SB PW4ENG 79−75) Remove the (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows. See Figure 302.

(a) Remove the bolts, nuts and clamps that attach the tube to the main oil filter tube at approximately the 6 o'clock position.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters).

(b) Remove the bolts that attach the tube to the main oil pump and remove the tube from the engine.

(c) Remove and discard the packing. Install protective closures.

(d) Remove the six loop clamp grommet halves from the tube.

(10) (Post SB PW4ENG 79−75) Remove (front) No. 4 bearing oil scavenge hose and tube assembly (LR05) as follows. See Figure 302.

(a) Remove the bolts, nuts and clamps that attach the hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or adapter.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters).

(b) Remove lockwire from the tube nut to the main oil pump connection. Remove bolts securing tube to main oil pump and remove tube from engine.

(c) Remove and discard packing. Install protective closures.

(d) Remove the bolts that secure the loop clamp bracket to the TCC manifold bridge bracket. Remove the loop clamp bracket.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(11) (Pre SB PW4ENG 79−75) Remove main filter oil tube assembly (LP01) as follows. See Figure 302.

NOTE: Make sure all the oil has been drained from the main oil filter housing.

(a) Remove bolts that attach the tube to the front of the main oil filter housing.

(b) Remove the bolts and bracket that attach the tube to the top of the main oil pump.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters) at the lower end of tube.

(c) Remove the bolt, nut and clamp that attach the tube to the diffuser case bracket at approximately the 7 o'clock position.

(d) Remove the bolts, nuts and clamps that attach the tube to the gearbox brackets at approximately the 8 o'clock position and remove tube from engine.

(e) Remove the six (clip−on) loop clamp grommet halves from the tube.

(f) Remove and discard packings. Install protective closures.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(12) (Post SB PW4ENG 79-75) Remove the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86) and the main oil filter hose and tube assembly (LP01) as follows. See Figure 302.

NOTE: Ensure oil has been previously drained from main oil filter housing.

(a) Remove bolts securing the hose and tube assembly to the front of the main oil filter housing.

(b) Remove the bolts and bracket that hold the hose and tube assembly to the top of the fluid pressure dampener or adapter.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters) at lower end of tube.

(c) Remove bolt, nut and clamp securing tube to diffuser case bracket at approximately 7 o'clock position.

(d) Remove bolts, nuts and clamps securing tube to gearbox brackets at approximately 8 o'clock position and remove tube from engine.

(e) Remove the bolts and nuts that hold the loop clamp bracket to the fluid pressure dampener or adapter. Remove the bracket.

(f) Remove the bolts that hold the fluid pressure dampener or adapter to the top of the main oil pump. Remove the fluid pressure dampener or adapter from the main oil pump.

(g) Remove and discard packings. Install protective closures.

(13) Remove the LPT case cooling (TCC) manifold assemblies (AC01) through (AC14) as follows.

(a) Remove bolts that attach all the manifold ends (upper and lower) to the manifold (collector).

(b) Remove the bolts, nuts and bracket that attach the cooling air manifold support brackets to the brackets on Flange N.

(c) Remove the bolts, nuts and clamps that attach the rear mounts of the cooling manifolds to the brackets on Flange P.

(d) Move the lower LPT cooling air manifolds around the LPT case to disengage the manifolds from the collector and remove the manifolds from the engine.

(e) Move the upper LPT cooling air manifolds around the LPT case to disengage the manifolds from the collector and remove the manifolds from the engine. Install protective closures.

(14) Remove LPT case cooling manifold (collector) as follows.

(a) Remove the bolts that attach the collector to the support bracket and the LPT cooling valve flange.

(b) Remove the bolts and clamps that attach the front bracket on the collector to the Flange N bracket.

(c) Remove the bolts and nuts that attach the rear of the collector to the Flange P brackets.

(d) Remove the collector from the engine and install protective closures.

(15) Remove the (lower right) turbine vane cooling air duct (AP02) as follows.

(a) Remove the lockwire and bolts that attach the turbine vane cooling air duct rear flange to the HPT case at approximately the 4 o'clock position.

(b) Remove the bolts and nuts that attach the cooling air duct front flange to the turbine vane and blade cooling air valve on the HPC case.

(c) Remove the bolts, nuts and clamp that attach the duct to the Flange M bracket and remove the duct from the engine.

(d) Remove and discard the gaskets. Install protective closures.

(16) Remove the (lower right) turbine blade cooling tube assembly (AP37) as follows.

(a) Remove the lockwire, bolts and bracket that attach the tube flange to the diffuser case at approximately the 5 o'clock position.

(b) Remove the bolt, nut, and clamp that attaches the fuel manifold to the bracket. Remove the bracket.

(c) Remove the bolts and bracket that attach the tube flange to the turbine vane and blade cooling valve on the HPC case.

(d) Remove the bolts, nuts and clamps that attach the tube to the diffuser case brackets.

(e) (Pre SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the metering plate and tube locks. Install the protective closures.

(f) (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Remove the tube from the engine. Remove and discard the gaskets. Remove the ring spacer and tube locks. Install the protective closures.

(17) Remove the (lower front) turbine case cooling (TCC) HPT manifold assembly (AC25) as follows.

(a) Remove the bolt that attaches the manifold end to the HPT collector.

(b) Remove the bolts and nuts that attach the manifold clamps to the brackets attached to the Flange M brackets at approximately the 4, 7 and 9 o'clock positions.

(c) Remove the bolts and nuts that attach the manifold loop clamp brackets to the Flange M brackets at approximately the 4, 7 and 9 o'clock positions.

(d) Turn and lower the manifold to disengage it from the HPT collector and remove the manifold from the engine. Install protective closures.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−03

Task 72−00−54−050−001:

1. Remove The (PT4.95) Average Pressure And Temperature Probes
    - A. Equipment And Materials Required − None
    - B. Procedure

      See Figure 301.
        - (1) Remove each (PT4.95) average pressure and temperature probe from the exhaust case as follows.
            - (a) Remove the four nuts, lockwashers, and TT4.95 cable ends from the probe studs.
            - (b) Remove the lockwire and disconnect the EEC PT4.95 manifold (AS33) or tube (AS34) from the probe.
            - (c) Remove the lockwire and the two bolts that attach the TT4.95 thermocouple to the probe. Remove the thermocouple. Remove the remaining bolt and the probe.

              NOTE: Remove the adjacent PT4.95 manifold and TT4.95 cable clamp bolts as necessary for the probe removal.
            - (d) Install the covers.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−04

Task 72−00−54−050−002−A:

1. Remove The EGT (TT4.95) Thermocouple Cable − For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72−134)
   A. Equipment And Materials Required − None
   B. Procedure − Right Side
      See Figures 301 and 302.
      (1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the two thermocouple locations. See Views A and C.
      (2) Remove the lockwire and four screws that attach the cover and ground terminal to the junction box. Remove the cover. See Figure 302.
      (3) Remove the two screws that attach the upper and lower clamp halves and the left and right thermocouple cable leads to the junction box. Remove the clamp halves.
      (4) Remove the nuts that attach the W6 cable leads and the right thermocouple cable leads to the junction box terminal studs. Remove the leads from the studs. Install the nuts on the studs.
      (5) Remove the four bolts that attach the inner front bracket and inner rear bracket to the outer support bracket at approximately the 7 o'clock position on the exhaust case. Remove the inner brackets from the engine. See View J.
      (6) Remove the four bolts securing the front and rear ends of the outer support bracket to the brackets on Flanges P and T. Remove the outer support bracket.
      (7) Remove the bolts and nuts that attach the cable clamps to the brackets on Flange T. Remove the cable from the engine.

         NOTE: The more information on the maintenance of the thermocouple cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77−21−04 (Harco Laboratories).

   C. Procedure − Left Side
      See Figures 301 and 302.
      (1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the two thermocouple locations. See Views E and I.
      (2) Remove the lockwire and four screws that attach the cover and ground terminal to the junction box. Remove the cover. See Figure 302.

EGT (TT4.95) Thermocouple Cable Junction Box
(Pre SB PW4ENG 72−134)
Figure 302
(Task 72−00−54−050−002−A)

(3) Remove the two screws that attach the upper and lower clamp halves and the left and right thermocouple cables to the junction box. Remove the clamp halves.
(4) Remove the nuts that attach the W6 cable leads and the right and left thermocouple cable leads to the junction box terminal studs. Remove the leads from the studs. Install the nuts on the studs.
(5) Remove the four bolts that attach the inner front bracket and inner rear bracket to the outer support bracket at approximately the 7 o'clock position on the exhaust case. Remove the inner brackets from the engine. See View J.
(6) Remove the four bolts securing the front and rear ends of the outer support bracket to the brackets on Flanges P and T. Remove the outer support bracket.
(7) Remove the bolts and nuts that attach the cable clamps to all brackets and adjacent PT4.95 manifold clamps.
(8) Remove the lockwire and bolt that attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position. See View E. Remove the cable from the engine.

NOTE: For more information on the maintenance of the thermocouple cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77−21−04 (Harco Laboratories).

Task 72-00−54−050−002−B:

2. Remove The EGT (TT4.95) Thermocouple Cable − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

A. Equipment And Materials Required − None

B. Procedure − Right Side
See Figures 303 and 304.

(1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the two thermocouple locations. See Views A and C.
(2) Remove the nut, bolt and clamps that attach the bottom two leads to the EEC PT4.95 manifold (AS33) at the 4:30 o'clock thermocouple. See View C.
(3) Remove the lockwire and four screws that attach the cover and ground terminal to the junction box. Remove the cover. See Figure 303.
(4) Remove the two screws that attach the upper and lower clamp halves and the left and right thermocouple cables to the junction box. Remove the clamp halves.

(5) Remove the nuts that attach the W6 cable leads and the right thermocouple cable leads to the junction box terminal studs. Remove the leads from the studs. Install the nuts on the studs.
(6) Remove the bolts that attach the front positioning plate to the front support bracket. Remove the positioning plate. See View J.
(7) Remove the bolts and nut that attach the positioning plate to the support bracket at approximately the 5 o'clock position. Remove the positioning plate. See View D.
(8) Remove the bolts and nuts that attach the cable clamps to all the remaining brackets. Remove the cable from the engine.

NOTE: For more information on the maintenance of the thermocouple cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77-21-04 (Harco Laboratories).

C. Procedure - Left Side
See Figures 303 and 304.
(1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the two thermocouple locations. See Views E and I.
(2) Remove the nut, bolt and clamp that attach the top two leads to the bracket on the EEC PT4.95 tube (AS34) at the 10 o'clock thermocouple. See View E.
(3) Remove the nut, bolt, spacer and clamp that attach the bottom two leads to the bracket at the 7 o'clock thermocouple. See View I.
(4) Remove the lockwire and four screws that attach the cover and ground terminal to the junction box. Remove the cover. See Figure 304.
(5) Remove the two screws that attach the upper and lower clamp halves and the left and right thermocouple cables to the junction box. Remove the clamp halves.
(6) Remove the nuts that attach the W6 cable leads and the right and left thermocouple cable leads to the junction box terminal studs. Remove the leads from the studs. Install the nuts on the studs.
(7) Remove the bolts that attach the front positioning plate to the front support bracket. Remove the positioning plate. See View J.
(8) Remove the bolts that attach the rear positioning plate to the rear support bracket. Remove the positioning plate. See View J.

(9) Remove the bolts and nuts that attach the cable clamps to all brackets and adjacent PT4.95 tube/manifold clamps.

(10) Remove the lockwire and bolt that attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position. See View E. Remove the cable from the engine.

NOTE: For more information on the maintenance of the thermocouple cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77-21-04 (Harco Laboratories).

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-05

Task 72-00-54-050-003-A:

1. Remove The EGT (TT4.95) Box And Cable Assembly - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)
   A. Equipment And Materials Required - None
   B. Procedure
      See Figures 301 and 302.
      (1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the four thermocouple locations. See Views A, C, E, And I.
      (2) Remove the lockwire and four screws that attach the cover and ground terminal to the junction box. Remove the cover. See Figure 302.
      (3) Remove the nuts that attach the W6 cable leads to the junction box terminal studs. Remove the W6 cable leads from the studs. Install the nuts, cover, and screws handtight only.
      (4) Remove the four bolts that attach the inner front bracket and inner rear bracket to the outer support bracket at approximately the 7 o'clock position on the exhaust case. Remove the inner brackets from the engine. See View J.
      (5) Remove the four bolts securing the front and rear ends of the outer support bracket to the brackets on Flanges P and T. Remove the outer support bracket.
      (6) Remove the lockwire and bolt that attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position. See View E.
      (7) Remove the bolts and nuts that attach the cable clamps to all brackets and to adjacent PT4.95 manifold (AS03) clamps.
      (8) Remove the nuts that attach the box and cable assembly to the bracket on Flange P. Remove the box and cable assembly from the engine.

NOTE: For more information on the maintenance of the box and cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77-21-04 (Harco Laboratories).

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−05

Task 72−00−54−050−003−B:

2. Remove The EGT (TT4.95) Box And Cable Assembly − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)
   A. Equipment And Materials Required − None
   B. Procedure
      See Figures 303 and 304.
      (1) Remove the four nuts and lockwashers that attach the cable leads to the thermocouple terminal studs. Remove the cable leads from the studs. Install the lockwashers and nuts on the studs. Do this step at the four thermocouple locations. See Views A, C, E, And I.
      (2) Remove the nut, bolt and clamps that attach the bottom two leads to the EEC PT4.95 manifold (AS33) at the 4:30 o'clock thermocouple. See View C.
      (3) Remove the nut, bolt, and clamp that attach the top two leads to the bracket on the EEC PT4.95 tube (AS34) at the 10 o'clock thermocouple. See View E.
      (4) Remove the nut, bolt, spacer and clamp that attach the bottom two leads to the bracket at the 7 o'clock thermocouple. See View I.
      (5) Remove the lockwire and four screws that attach the cover to the junction box. Remove the cover. See Figure 304.
      (6) Remove the nuts that attach the W6 cable leads to the junction box terminal studs. Remove the W6 cable leads from the studs. Install the nuts, cover, and screws handtight only.
      (7) Remove the bolts and nut that attach the positioning plate to the support bracket at approximately the 5 o'clock position. Remove the positioning plate. See View D.
      (8) Remove the bolts that attach the front positioning plate to the front support bracket. Remove the positioning plate. See View J.
      (9) Remove the bolts that attach the rear positioning plate to the rear support bracket. Remove the positioning plate. See View J.
      (10) Remove the lockwire and bolt that attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position. See View E.
      (11) Remove the bolts and nuts that attach the cable clamps to all brackets and adjacent PT4.95 tube/manifold clamps.

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-06

Task 72-00-54-050-004-A:

1. Remove Exhaust Gas Temperature Thermocouples, TT4.95 - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)
    - A. Equipment And Materials Required - None
    - B. Procedure

      See Figure 301.
        - (1) Remove four nuts and washers securing cable to thermocouple connections. Remove cable ends from thermocouple.
        - (2) Remove thermocouple at Location A (10 o'clock position) as follows.
            - (a) Remove lockwire and disconnect EEC PT4.95 manifold (AS03) from pressure probe. Loosen clamp bolts attaching manifold to Flange T brackets as required to gain clearance for thermocouple removal.
            - (b) Remove lockwire and two bolts securing thermocouple to housing and exhaust case. Remove thermocouple.
        - (3) Remove thermocouple at Location B (7 o'clock position) as follows.
            - (a) Remove bolt and nut securing EEC PT4.95 manifold (AS03) to bracket.
            - (b) Remove lockwire and two bolts securing thermocouple and bracket to housing and exhaust case. Move bracket rearward and remove thermocouple.
        - (4) Remove thermocouple from Locations C and D (4 o'clock and 1 o'clock position) as follows.
            - (a) Remove lockwire and two bolts (each location) securing thermocouple and bracket to housing and exhaust case. Move bracket rearward and remove thermocouple.
        - (5) Install protective closures.

          NOTE: For additional information concerning detailed maintenance of this component see EGT (TT4.95) Thermocouple Probes Component Maintenance Manual, 77-21-05 (PW Manual PN 50A451).

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−06

Task 72−00−54−050−004−B:

2. Remove Exhaust Gas Temperature Thermocouples, TT4.95 − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 302.
     - (1) Remove four nuts and washers that attach the thermocouple wires to the thermocouple connections. Remove the thermocouple connectors from thermocouple.
     - (2) Remove the thermocouple at Location A (10 o'clock position) as follows.
       - (a) Remove the bolt and nut from the clamp on the thermocouple wires and the brazed on bracket on the EEC PT4.95 tube (AS34). Remove the lockwire and disconnect the EEC PT4.95 tube (AS34) from the pressure probe. Loosen the clamp bolts that attach the manifold to brackets on Flange T as necessary to get clearance for the thermocouple removal.
       - (b) Remove the lockwire and the two bolts that attach the thermocouple to the housing and exhaust case. Remove the thermocouple.
     - (3) Remove the thermocouple at Location B (7 o'clock position) as follows.
       - (a) Remove the bolt and nut that attach the EEC PT4.95 manifold (AS33) to the bracket on Flange T.
       - (b) Remove the bolt, nut and spacer from the clamp on the thermocouple wires. Remove the lockwire and the two bolts that attach the thermocouple and bracket to the housing and exhaust case. Move the bracket rearward and remove the thermocouple.
     - (4) Remove the thermocouple from Location C (4 o'clock position) as follows.
       - (a) Remove the bolt and nut from the clamps on the thermocouple wires and the EEC PT4.95 manifold (AS33). Remove the lockwire and disconnect the EEC PT4.95 manifold (AS33) from the pressure probe.
       - (b) Remove the lockwire and the two bolts that attach the thermocouple and bracket to the housing and exhaust case. Move the bracket rearward and remove the thermocouple.
     - (5) Remove the thermocouple at Location D (1 o'clock position) as follows.
       - (a) Remove the lockwire and the bolts that attach the thermocouple and bracket to the housing and exhaust case. Move the bracket rearward and remove the thermocouple.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−07

Task 72−00−54−050−005:

1. Remove EGT (TT4.95) Thermocouple Housing
   - A. Equipment And Materials Required − None
   - B. Procedure

     See Figure 301.
     - (1) Remove nuts and washers securing cable ends to thermocouple connections. Remove cable ends from thermocouple.
     - (2) Remove lockwire and two bolts securing thermocouple to boss on case. At Location B only, remove bolt and nut securing EEC PT4.95 manifold (AS33) to bracket.
     - (3) At Location B remove the bolt, nut and spacer from the clamp on the thermocouple wires (Post SB PW4ENG 72−134).
     - (4) Remove remaining bolt securing EGT (TT4.95) thermo− couple housing to exhaust case boss.
     - (5) Move bracket to rear and remove EGT thermocouple probe. Remove housing from case.
     - (6) Install protective closures.

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-08

Task 72-00-54-020-002:

1. Remove No. 4 Bearing And Seals

NOTE: See Figure 301 for part/assembly removal sequence.

A. Equipment And Materials Required

Standard Tools:
.190-32 Jackscrews, Eight Required Per Text

Special Tools:

PWA 3755	Pump, Hydraulic (Optional To PWA 29389)
PWA 29389	Pump, Hydraulic
PWA 75284	Puller, Knocker
PWA 85307	Puller, Jackscrew
PWA 85431	Puller, Hydraulic
PWA 85432	Puller, Hydraulic
PWA 85434	Puller, Jackscrew (Optional to PWA 87053)
PWA 85446	Puller, Jackscrew
PWA 87053	Puller

B. Procedure

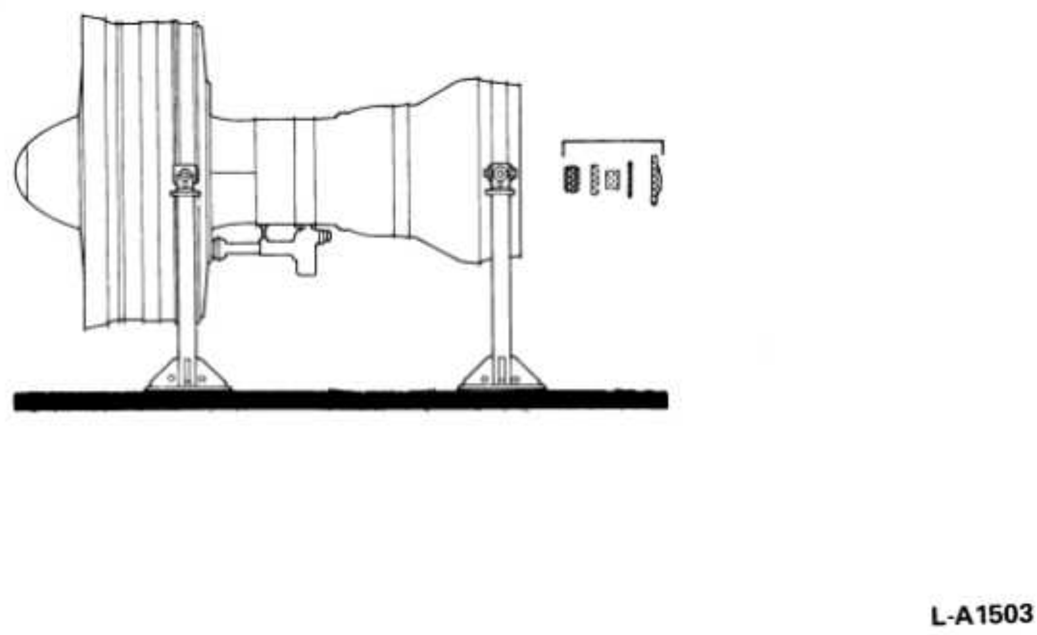
(1) Remove bolts (302/6) securing No. 4 bearing shield (302/5) to turbine exhaust case (rear inner flange) (302/1). Remove shield. Remove No. 4 bearing heat shield (302/4). See Figure 302.

(2) Remove No. 4 bearing cover (302/3).

  (a) For No. 4 bearing cover (302/3) that has six small threaded holes (Pre SB PW4ENG 72-385), install the PWA 85307 Jackscrew Puller to the rear inner bolt hole flange (Flange T1) of the exhaust case and attach with two bolts, washers and nut details. Install the small plate of the puller to the six threaded holes in the cover and attach with six knurled screw details. Turn the jackscrew to disengage the cover from the exhaust case. Remove the puller and the cover from the exhaust case. Remove the cover from the puller. Discard the packing (302/2).

  (b) For cover that has eight jackscrew holes (Post SB PW4ENG 72-385), install and evenly tighten eight 0.190-32 Jackscrews to remove the cover. Discard the packing (302/2).

(3) Remove No. 4 bearing (oil) nozzle and No. 4 bearing packing transfer tube from boss in exhaust case (No. 4 bearing compartment) at 1:30 o'clock position. See Figure 303.



Procedure Sequence
Figure 301
(Task 72-00-54-020-002)

(a) Remove bolts (303/7) and key washers (303/6) and (303/8) securing No. 4 bearing packing transfer tube (303/5) to No. 4 bearing nozzle (303/3). Remove tube.

(b) Remove bolts (303/1) and key washers (303/2) and (303/4) securing No. 4 bearing nozzle (303/3) to exhaust case. Remove nozzle.

(4) Remove No. 4 bearing oil scavenge (inner) tube (304/4). See Figure 304.

(a) Remove key washer (304/2) and bolt (304/3) securing scavenge tube bracket to exhaust case inner flange at 6 o'clock position.

(b) Remove key washers (304/2) and bolts (304/3) securing scavenge tube to exhaust case inner flange at 7:30 o'clock location. Remove scavenge tube. Discard packing (304/1).

Figure 304
(Task 72−00−54−020−002)

(5) Position 12 to 16 brass shims equally spaced over 90 − 110 degree arc. Place shims just to rear of knife−edge seal between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(6) Remove No. 4 bearing retaining plate (305/3). See Figure 305.

  (a) Remove bolts (305/5) and key washers (305/4) securing retaining plate to front compressor drive turbine shaft (305/6). Discard key washers.

  CAUTION: USE CARE WHEN ACTUATING PULLER (PWA 75284). DAMAGE TO NO. 4 BEARING OIL SCAVENGE TUBE MAY RESULT BY SUDDEN REARWARD MOVEMENT OF PULLER WHEN NO. 4 BEARING RETAINING PLATE IS RELEASED FROM ENGINE.

  (b) Rotate knurled nut detail of PWA 75284 Knocker Puller to retract jaws. Install puller onto retaining plate with jaws in line with slots in retaining plate wall. Tighten knurled nut to secure jaws in retaining plate. Using slide hammer, remove retaining plate from shaft. Remove puller.

  (c) Discard packing (305/2).

(7) Remove No. 4 bearing outer race and rollers. (306/2) See Figure 306.

  (a) Remove bolts (306/6) and key washers (306/4) and (306/5) securing four No. 4 bearing retaining plates (306/3) to rear face of exhaust case inner flange.

  (b) Position four legs of PWA 85446 Jackscrew Puller into slots in bearing outer race and rotate to secure legs in puller groove of bearing.

  (c) Hold center handle of puller and turn large jacking nut to remove outer race from exhaust case. Remove puller. Remove two seal rings (306/1).

  CAUTION: BEARING INNER RACE IS INSTALLED ON FRONT COMPRESSOR DRIVE TURBINE SHAFT. ENSURE THAT ALL BEARING DETAILS ARE KEPT TOGETHER. MIXING OF BEARING DETAILS MAY CAUSE DAMAGE TO BEARING.

  (d) Place No. 4 bearing outer race and rollers into suitable container.

(8) Remove No. 4 bearing (rear) seal spacer (307/5) and inner race (307/6) from front compressor drive turbine shaft (307/1) using PWA 85431 Puller. See Figure 307.

No. 4 Bearing And Seals Removal
Figure 307
(Task 72−00−54−020−002)

(a) Remove jaw retaining ring from puller and slide three jaws outward.

(b) Position puller on end of front compressor drive turbine shaft secure inner locating ring to turbine shaft with three detail screws.

(c) Slide three jaws inward behind puller lip of No. 4 bearing (rear) seal spacer (307/5). Install retaining ring over jaws and seat on lugs of jaws.

(d) Attach PWA 3755 or PWA 29389 Hydraulic Pump to hydraulic cylinder on puller.

(e) Actuate pump to remove inner race and spacer turbine shaft.

(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.

(g) Remove bearing inner race and spacer from turbine shaft and store parts in suitable container.

(9) Remove No. 4 bearing (front) seal spacer (307/3) and No. 4 bearing (carbon) face seal (307/4) using PWA 85434 or PWA 87053 Puller.

(a) Rotate outer plate to centralize three puller legs between arms of inner plate. Slide three puller legs inward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner plate to turbine shaft with three detail screws.

(c) Slide three puller legs outward to engage puller lip in ID of No. 4 bearing seal spacer. It may be necessary to turn jackscrew to align puller lip on jaws with puller groove in spacer. Rotate outer plate detail to align puller legs with three arms of inner plate detail to secure puller.

(d) Turn center jackscrew to remove seal and spacer.

(e) Rotate outer plate to centralize three puller legs between arms of inner plate. Loosen screws and slide jaws inward. Remove screws securing inner plate to turbine shaft and remove puller from shaft.

(f) Remove (carbon) face seal and seal spacer from turbine shaft and store parts in suitable containers.

(10) Remove 6th stage LPT airseal (307/2) from front compresser drive turbine shaft (307/1) using PWA 85432 Puller.

(a) Remove jaw retaining ring from puller and slide four jaws outward.

(b) Position puller on end of front compressor drive turbine shaft. Secure inner locating ring to turbine shaft with two detail screws.
(c) Slide four jaws inward, engaging puller legs in four holes in side of airseal. Install retaining ring over jaws and seat on lugs of jaws.
(d) Attach PWA 3755 or PWA 29389 Hydraulic Pump to hydraulic cylinder on puller.
(e) Actuate pump to remove airseal from turbine shaft.
(f) Disconnect hydraulic pump. Remove retaining ring and slide jaws outward. Remove bolts securing locating ring to turbine shaft. Remove puller from engine.
(g) Remove airseal from turbine shaft and store in suitable container.

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-09

Task 72-00-54-050-006-A:

1. Remove EEC Thermocouple And Airframe Cable (W6) - For Engines Without The Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)

NOTE: This procedure provides for removal of EEC thermocouple and airframe cable (W6) and cable tube (support).

A. Equipment And Materials Required - None

B. Procedure
See Figure 301 and Figure 302.

(1) Before disconnecting cable leads, tag each lead and terminal stud to facilitate proper reinstallation.

CAUTION: AVOID TWISTING OR SEVERE BENDING OF CABLE AT ANY TIME DURING REMOVAL OR DAMAGE TO CABLE MAY RESULT.

(2) Remove lockwire and four screws securing cover and ground lead to EGT (TT4.95) box and cable assembly junction box located at 5:30 o'clock position on turbine exhaust case. Remove cover. See Figure 302.

(3) Remove four nuts and disconnect cable leads from junction box. Reinstall nuts on terminal studs.

NOTE: Chromel nut and terminal stud diameters are smaller than those of alumel nuts and terminal studs.

(4) Remove four nuts and disconnect cable leads from TT3 thermocouple located at approximately 3 o'clock position on diffuser case. Reinstall nuts on terminal studs. See View H.

NOTE: Chromel nut and terminal stud diameters are smaller than those of alumel nuts and terminal studs.

(5) Disconnect W6P12 cable connector from W5J12 cable connector located on Flange K at 3:30 o'clock position. Install protective closures on each cable connector.

(6) Remove nuts, bolts, and spacers securing cable clamps to brackets and to clamps brazed on cable tube (support). Remove cable.

(7) Remove bolt, nut, and spacer securing cable tube (support) to bracket on LPT cooling air manifold support at 5 o'clock position. See View C.

(8) Remove bolt and nut securing cable tube (support) to bracket on rear flange of (lower right) turbine vane cooling air tube (AP02) at 3:30 o'clock position. See View F.

(9) Remove nut, bolt, and spacer securing lower rear end of cable tube (support) to bracket located on Flange P at approximately 5 o'clock position. Remove cable tube (support).

Task 72−00−54−050−006−B:

2. Remove EEC Thermocouple And Airframe Cable (W6) − For Engines With Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

A. Equipment And Materials Required − None

B. Procedure
See Figures 303, 304 and 305.

(1) Before you disconnect the cable wires (leads), tag each wire (lead) and terminal stud to help with the correct installation.

CAUTION: DO NOT TWIST OR BEND THE CABLE BADLY DURING REMOVAL, OR DAMAGE TO THE CABLE CAN OCCUR.

(2) Remove the lockwire and the four screws that attach the cover and the ground wire (lead) of the EGT (TT4.95) box and cable assembly to the junction box at the 5:30 o'clock position on the turbine exhaust case. Remove the cover. See Figure 305.

(3) Remove the four nuts and disconnect the cable wires (leads) from the terminal studs on the junction box. Install the nuts back onto the terminal studs.

NOTE: The diameter of the chromel nuts and terminal studs is smaller than the diameter of the alumel nuts and terminal studs.

(4) Remove the four nuts and disconnect the cable wires (leads) from the TT3 thermocouple on the diffuser case at approximately the 3 o'clock position. Install the nuts back onto the terminal studs. See View M for pre SB PW4ENG 73−163 configuration. See View T for post SB PW4ENG 73−163 configuration.

NOTE: The diameter of the chromel nuts and terminal studs is smaller than the diameter of the alumel nuts and terminal studs.

(5) Disconnect the W6P12 cable connector from the W5J12 cable connector.

(a) (Pre SB PW4ENG 73−163) Connectors are on a bracket outboard of Flange K at the 3 o'clock position.

(b) (Post SB PW4ENG 73−163) Connectors are on the TCA tube flange bracket on the turbine blade cooling air tube (lower right) (AP37) flange at the 3 o'clock position.

1 (Post SB PW4ENG 73−192) Loosen clamp that attaches the cooling hose to the cooling shield around the W6P12 connector. Remove cooling hose from the cooling shield. See Figure 304 (Sheet 15).

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

2 (Post SB PW4ENG 73−192) Loosen and remove the clamp attaching the two halves of the cooling shield around the W6P12 connector. Remove the shields and clamp from the connector.

(6) Remove the nuts, bolts, and cable clamps that attach the cable to brackets on Flange P. See Views A and B.

(7) Remove the nuts, bolts, and cable clamps from brackets and from clamps brazed on the cable tube (support). Remove cable.

(8) Remove the nut, bolt, and clamp that attach the cable tube (support) to a bracket on the turbine cooling air support at approximately the 5 o'clock position. See View D.

(9) Remove the nut, bolt, and clamp that attach the cable tube (support) to a bracket on the high turbine cooling air manifold support at approximately the 4 o'clock position. See View H.

(10) Remove the nut, bolt, and clamp that attach the cable tube (support) to a bracket on the (lower right) turbine vane cooling air tube (AP02) at approximately the 3:30 o'clock position. Remove the cable tube (support). See View J.

ENGINE GENERAL − TURBINE EXHAUST CASE − REMOVAL−10

Task 72−00−54−050−007:

1. Remove EGT (TT4.95) Thermocouple Junction Box
    A. Equipment And Material Required − None
    B. Procedure
        See Figure 301.
        (1) Before disconnecting electrical leads, tag each lead and stud to facilitate proper reinstallation.
        (2) Remove lockwire and four screws securing cover and ground lead to junction box. Remove cover.
        (3) Remove two screws securing upper and lower clamp halves and thermocouple cable to junction box. Remove clamp halves.
        (4) Remove nuts and disconnect W6 cable and thermocouple cable leads from junction box studs. Reinstall nuts on studs.
        (5) Remove four nuts securing junction box to bracket on Flange P. Remove junction box from engine.

NOTE: For additional information concerning detailed maintenance of box and cable assembly, see EGT (TT4.95) Thermocouple Box And Cable Component Maintenance Manual, 77−21−04 (Harco Laboratories).

ENGINE GENERAL - TURBINE EXHAUST CASE - REMOVAL-20

Task 72-00-54-020-005:

1. Remove The Flange P Brackets And Hardware

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Remove the Flange P brackets as follows. See Figure 301.

         (a) Tag and identify the flange P hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove the nuts and bolts, which attach the brackets at Flange P.

Task 72-00-54-420-001:

1. Install Turbine Exhaust Case

NOTE: See Figure 401 for part/assembly installation sequence.

A. Prerequisites

(1) See 72-00-54, Inspection/Check-01 Task 72-00-54-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

	PWA 25040	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
	PWA 25041	Bracket, Support (Optional To PWA 85195 Bracket For Engines With Exhaust Nozzle Removed)
	PWA 25757	Pedestal, Fixed
	PWA 25758	Pedestal, Adjustable
	PWA 25926	Adapter
	PWA 28374	Guide
	PWA 28414	Bracket, Support (Optional To PWA 85195 For Engine Horizontal Support)
	PWA 28657	Sling, Strongback
	PWA 29243	Bracket, Support (2 Necessary) (Optional To PWA 85195 Brackets For Engine Horizontal Support)
	PWA 75995	Support
	PWA 76154	Adapter (2 Necessary)
	PWA 85195	Bracket, Support (2 Necessary)
	PWA 85305	Pins, Aligning (2 Necessary)
	PWA 85452	Eye, Lifting (Optional To PWA 28657)
R R	PWA 85453	Drift, Install (Optional to PWA 106326)
	PWA 85850	Guide, Piloting (Optional To PWA 28374)
	PWA 86438	Adapter
	PWA 102178	Support Rear (Optional To PWA 75995 And PWA 85696)
R R	PWA 106326	Drift, Install (No. 4 Bearing Inner Race, Seals, And Spacers)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72−54−00/4/90
Packing	1	72−54−00/5/90
Key Washer	8	72−54−00/4/110

C. Procedure

(1) Ensure that No. 4 bearing (carbon) face seal gap dimensional requirement (Reference 829) is met.

(2) (Reference 1003) Install No. 4 bearing inner race, face seal (carbon) and seal spacers (front) and (rear). See Figure 402 and Figure 403.

NOTE: All parts must be within ± 10°F (± 5.6°C) when making all measurements.

(a) Stack 6th stage airseal (402/2), No. 4 bearing seal spacers (front) (402/3) and rear (402/5) and No. 4 bearing inner race (402/6) on bench. Ensure that zero clearance is maintained between mating faces. Measure overall stacking dimension and record as Dimension N.

(b) Measure dimension from 6th stage airseal shoulder Face P, to rear face of front compressor drive turbine shaft (402/1). Record as Dimension R.

(c) Dimension N − Dimension R must equal 0.005 − 0.020 inch (0.13 − 0.51 mm).

(d) Position 6th stage LPT airseal (403/2) on front compressor drive turbine shaft (403/1). Seat airseal onto shoulder of rear hub using PWA 85453
R or PWA 106326 Drift and mallet.

(e) Install No. 4 bearing (front) seal spacer (403/3), (carbon) face seal (403/4) and (rear) seal spacer (403/5) onto front compressor drive turbine shaft (403/1). Seat parts using PWA 85453 or PWA 106326 Drift and mallet. R

(f) Heat the No. 4 bearing inner race (403/5). See Standard Practices Manual, PN 585005.

(g) Install the heated No. 4 bearing inner race onto front compressor drive turbine shaft (403/1). Using PWA 85453 or PWA 106326 Drift and mallet, seat inner race and previously installed spacers. R

(h) Measure Dimension S from rear face of No. 4 bearing inner race to rear face of front compressor drive turbine shaft (402/1). See Figure 402.

(i) Dimension S must equal Dimension N - Dimension R plus 0.000 or minus 0.001 inch (plus 0.000 or minus 0.025 mm).

(j) If Dimension S is not within limits, remove bearing inner race, spacers and seals from turbine shaft and repeat steps (d) through (i).

(3) Install PWA 85195 Support Bracket, PWA 29243 Support Bracket, PWA 25040 Support Bracket and PWA 25041 Support Bracket or PWA 28414 Support Bracket to turbine exhaust case at 3 and 9 o'clock locations.

NOTE: PWA 29243 Support Bracket or PWA 28414 Support Bracket may be used in place of PWA 85195 Support Bracket for horizontal support only.

NOTE: PWA 25040 Support Bracket and PWA 25041 Support Bracket may be used in place of PWA 85195 Support Bracket on engines with exhaust nozzle removed.

(a) Position brackets between case rails and align holes.

NOTE: If applicable, install PWA 25040 Bracket at 3 o'clock and PWA 25041 Bracket at 9 o'clock positions.

(b) For PWA 85195 Bracket or PWA 25040 Bracket and PWA 25041 Bracket, install pin from rear through flange and bracket. Secure pin with safety pin as necessary.

(c) For other brackets, insert pin through flanges and bracket and install bushings through flanges and into bracket. Secure pins with nuts.

(4) Attach hoist to PWA 28657 Sling. Using two PWA 76154 Adapters attach sling to spools of brackets on case. Raise case from pallet and trunnion to horizontal position.

NOTE: See following step for optional procedure using lifting eye for handling turbine exhaust case.

(5) If applicable, position PWA 85452 Eye to turbine exhaust case. Align attachment block details to bushing holes in case rails at 2 and 10 o'clock. Install pins through bushings and blocks. Secure pins with safety clips.

(6) Install two PWA 85305 Aligning Pins, 180 degrees apart, in Flange P.

(a) Remove two aligning pins from plate detail.

(b) Locate smaller .190−32 threaded bolt hole in turbine rear case and secure plate to front side of turbine rear case using detail screw.

(c) Insert two aligning pins through bolt holes in turbine case flange and thread into tapped holes in plate.

(7) For installing exhaust case assembly using PWA 75995 Support and PWA 85696 Adapter, proceed as follows: See Figure 404.

NOTE: See following step for installing exhaust case assembly using optional PWA 102178 Support.

(a) Align boltholes and insert flanged end of PWA 75995 Support into ID of front compressor drive turbine) shaft (404/6). Secure flange to turbine shaft with eight screws (404/5).

(b) Slide PWA 28374 Guide, larger diameter first, over PWA 75995 Support and seat against bearing inner race.

(c) Align boltholes and install PWA 86438 Adapter onto PWA 75995 Support and into inner flange of turbine exhaust case. Secure flange to case with five screws (404/2).

(8) For installing exhaust case assembly using PWA 102178 Support, proceed as follows: See Figure 404.

(a) Align boltholes and insert flanged end of shaft (404/3) into ID of front compressor drive turbine shaft (404/6). Secure flange to turbine shaft with eight screws (404/1).

NOTE: Lifting eye may be threaded into hole near end of shaft detail to aid in removal of shaft.

(b) Slide PWA 85850 Guide, larger diameter first, over PWA 102178 Support and seat against bearing inner race.

(c) Align boltholes and install hub (404/4) into inner flange of turbine exhaust case. Secure hub flange to case with five screws (404/2).

(9) Move exhaust case into position at rear of turbine rear case. Adjust hoist as required and slide hub (404/4) or PWA 86438 Adapter as applicable onto shaft or PWA 75995 Support as applicable.

(10) If installing exhaust case using PWA 75995 Support, position PWA 25758 Pedestal under spool at end of support and adjust accordingly.

(11) Remove PWA 85583 Fixture from low pressure turbine. See Figure 405.

(a) Loosen jamnuts (405/4) and nut (405/1) as required to lower support plate (405/2) from 6th stage LPT disk (405/3).

(b) Remove bolts (405/6) securing flange segment (405/5) to turbine rear case (405/7). Remove fixture.

(12) Slide exhaust case forward, mating bearing rollers on exhaust case with inner race on turbine shaft. Seat exhaust case front flange against turbine exhaust case rear flange.

(13) Install several bolts and nuts equally spaced and evenly tighten nuts to seat snap diameter. Remove aligning pins.

(14) Remove brass shims supporting low pressure turbine rotor. Shims are between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(15) Install Flange P bolts, brackets and nuts as follows. Refer to 72−00−54, Installation−20 Task 72−00−54−450−005.

(16) Install engine pedestal supports at turbine exhaust case. See Figure 406.

  (a) Raise rear of engine and remove saddle and pedestal from front of Flange M. If applicable remove PWA 25758 Pedestal from rear of engine.

  (b) Install PWA 25757 Pedestal and PWA 25926 Adapter and PWA 25758 Pedestal beneath brackets located at 3 and 9 o'clock locations on turbine exhaust case.

  (c) Lower rear of engine until brackets seat on pedestals.

(17) Remove hoist, sling and adapters from turbine exhaust case.

(18) Remove tool details from exhaust case rear flange and turbine rear shaft.

NOTE: Lifting eye may be threaded into hole near end of shaft detail to aid in removal of shaft.

(19) Lubricate new packing (407/2) with Engine Oil P03−001 and install packing into groove in front diameter of No. 4 bearing retaining plate (407/3). Align boltholes and install retaining plate into rear inner diameter of front compressor drive turbine shaft (407/11). Secure retaining plate using bolts (407/5) lubricated with Engine Oil P03−001 and key washers (407/4). Torque bolts to 75 − 85 lb−in. (8.474 − 9.604 N.m). Bend tabs of key washers. See Figure 407.

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

(20) Install the No. 4 bearing cover as follows:

(a) Apply Engine Oil P03−001 fully to the new packing (407/10).

(b) Install the new packing into the groove at the rear flange of the No. 4 bearing cover (407/9).

(c) Install the cover into the rear inner flange of the exhaust case (407/1).

(d) Install 4 work bolts equally spaced around the cover.

(e) Tighten the bolts equally in small increments to pull the cover into position equally.

(f) Monitor the engagement of the cover to make sure the packing is not cut.

(g) Remove the work bolts.

(21) Position No. 4 bearing heat shield (407/8) into recess in No. 4 bearing shield (407/7). Align bolt holes and install shield over previously installed No. 4 bearing cover (407/9) at rear inner flange of exhaust case. Secure shield with bolts, lubricated with Engine Oil P03−001. Use 30 bolts (407/6) for covers with 30 boltholes (Pre SB PW4ENG 72−456), or 16 bolts for covers with 16 boltholes (Post SB PW4ENG 72−456). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

D. Postrequisites

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−01

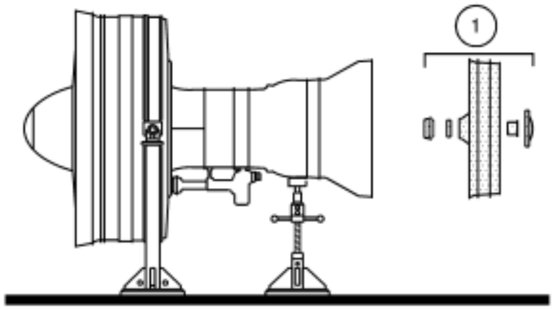
(1) Do a No. 4 bearing compartment vacuum check. Refer to 71−00−00, Testing−12 Task 71−00−00−720−003.

(2) Connect/install external parts to complete installation of turbine exhaust case per 72−00−54, Installation−02 Task 72−00−54−420−003.

(3) Install nacelle parts necessary to complete installation of turbine exhaust case per 71−00−54, Installation−01 Task 71−00−54−450−001.

(4) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−01



1. INSTALL TURBINE EXHAUST CASE.

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-02

Task 72-00-54-420-003:

1. Install External Plumbing After Turbine Exhaust Case Installation

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-059	Wax, Paraffin (PMC 9552)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75-24-00/2/95
Gasket	1	75-26-00/1/190
Gasket	1	75-26-00/1/200
Gasket	2	75-26-00/1/210
Packing	2	79-21-00/7/1
Packing	1	79-21-00/12/190
Packing	1	79-22-00/4/1
Seal Plate	1	75-24-00/2/90
Gasket	1	75-24-00/2/90C

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) Install (lower front) turbine case cooling (TCC) HPT manifold assembly (AC25) as follows.

(a) Raise and rotate manifold to engage manifold (collector) and install bolt, threads lubricated with Engine Oil P03-001, handtight only.

(b) Install HPT manifold loop clamp brackets to forward side of Flange M brackets at approximately 4, 7 and 9 o'clock positions, angled forward, with bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing manifold to manifold loop clamp brackets. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque bolt securing manifold to manifold (collector) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(2) Install the (lower right) turbine blade cooling tube assembly (AP37) as follows. See Figure 401.

CAUTION: INSTALL LOCK PLATES WITH SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. ENSURE LOCK PLATES ENGAGE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 401.

(a) Remove protective closures. Install gasket, with raised sealing surface visible, to elbow end of tube, aligning tube slot and four bolt holes. Secure in place with Paraffin Wax P05-059. Install ring gasket to elbow groove with Paraffin Wax P05-059. Install locks to engage diffuser case internal tube lip and with pin inward (if equipped). Secure the locks in place with Paraffin Wax P05-059.

(b) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip properly. See Figure 401 (Sheet 3).

(c) (Pre SB PW4ENG 72-57 or SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Install the gasket and metering plate in the four hole air shutoff valve flanged end of the tube and hold in place with Paraffin Wax P05-059.

(d) (Post PW4ENG 72−572 and Pre SB PW4ENG 72−627 or Post SB PW4ENG 72−537 and Pre SB PW4ENG 72−627) Install the gasket and ring spacer in the four hole air shutoff valve flanged end of the tube and hold in place with Paraffin Wax P05−059.

(e) Install gasket to lower flanged opening of air shutoff valve and secure in place with Paraffin Wax P05−059.

(f) Secure elbow end of tube (gaskets in place) and bracket to diffuser case pad at approximately 5 o'clock position with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(g) Secure opposite end of tube (gasket and metering plate in place) to air shutoff valve with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(h) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts to diffuser case brackets at three locations. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(i) Torque all bolts at each end of tube to 85 − 95 lb−in. (9.604 − 10.734 N.m), then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts at the diffuser case pad.

(j) Install clamp, bolt, threads lubricated with Engine Oil P03−001, and nut securing fuel manifold to bracket attached to tube flange at diffuser case. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(3) Install (lower right) turbine cooling tube assembly (AP02) as follows.

(a) Remove protective closures.

(b) Secure new gasket in place to valve flange at approximately 3 o'clock position with Paraffin Wax P05−059.

(c) Secure new gasket in place to pad at approximately 4 o'clock position on HPT case with Paraffin Wax P05−059.

(d) Install tube and bracket to HPT case pad and secure with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(e) Secure forward end of tube to air shutoff valve with bolts, threads lubricated with Engine Oil P03−001.

(f) Install tube clamp over tube at Flange M bracket and secure with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque clamp bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque bolts securing tube to air shutoff valve to 85 − 95 lb−in. (9.604 − 10.735 N.m), then retorque to required limit without loosening until required torque is maintained.

(h) Torque bolts securing tube to HPT case to 180 − 200 lb−in. (20.337 − 22.597 N.m), then retorque to required limit without loosening until required torque is maintained. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(4) Install LPT case cooling manifold (collector) as follows. See Figure 402.

(a) Remove protective closures and secure rear of manifold (collector) to Flange P brackets, at approximately 3 o'clock position, with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(b) Secure front of manifold (collector) to Flange N bracket with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(c) Install bolts, threads lubricated with Engine Oil P03−001, and nuts securing manifold (collector) to support bracket and LPT cooling air valve flange, handtight only.

(d) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque bolts securing manifold (collector) to LPT cooling air valve to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(5) Install LPT case cooling manifold (TCC) assemblies (AC01) through (AC14) as follows.

(a) Remove protective closures and position upper manifolds over top of LPT case and rotate to engage manifold (collector) at approximately 3 o'clock position.

(b) Position lower manifolds under LPT case and rotate to engage manifold (collector) at approximately 3 o'clock position.

1 Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to Flange P brackets with bolts, threads lubricated with Engine Oil P03-001, spacers and nuts tightened by hand (Pre SB PW4ENG 75-50).

2 Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to Flange P brackets with bolts, threads lubricated with Engine Oil P03-001, and nuts tightened by hand (Post SB PW4ENG 75-50).

(c) Install the cover assemblies on the upper and lower rear tubes (No. 7) of the manifold (collector) (Post SB PW4ENG 75-53).

(d) Install bolts, threads lubricated with Engine Oil P03-001, bracket and nuts securing upper and lower manifold support brackets to Flange N brackets handtight only.

(e) Install bolts, threads lubricated with Engine Oil P03-001, securing upper and lower manifolds to manifold (collector) and torque to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Install bolts, threads lubricated with Engine Oil P03-001 to attach the cover assemblies to the manifold (collector). Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m) (Post SB PW4ENG 75-53).

R
R

(g) Torque all bolts securing manifolds at Flanges N and P to 36 - 40 lb-in. (4.067 - 4.519 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE ETERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(6) (Pre SB PW4ENG 79-75) Install main filter oil tube assembly (LP01) as follows. See Figure 403.

(a) Remove protective closures and install packings lubricated with Engine Oil P03-001, to packing groove at each end of tube.

(b) Secure tube to forward side of main oil filter housing, with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(c) Secure tube to top of main oil pump with loop clamp bracket angled rearward and bolts, threads
R lubricated with Antiseize Paste P06-054, handtight
R only. Wipe off unwanted paste.

(d) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to gearbox brackets at approximately 8 o'clock position. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Install the two (clip-on) loop clamp grommet halves to the tube at the diffuser case bracket clamp location (Post SB PW4ENG 79-36 only).

(f) Install the clamp that attaches the tube to the diffuser case bracket. Install the bolt, lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque bolts securing tube to main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(h) Torque bolts securing tube and bracket to top of oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE ETERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(7) (Post SB PW4ENG 79−75) Install the fluid pressure dampener or install the fluid pressure adapter assembly (Post SB PW4ENG 79−86) and the main oil filter hose and tube assembly (LP01) as follows. See Figure 403.

(a) Remove the protective closures and install the packing lubricated with Engine Oil P03−001, to packing groove on the dampener or adapter.

(b) Install the dampener to the top of the main oil pump and secure with bolts, threads lubricated with Engine Oil P03−003, to a handtight condition only.

(c) Remove protective closures and install packing lubricated with Engine Oil P03−003, to packing groove at each end of oil tube assembly (LP01).

(d) Install one end of tube (LP01) to the forward side of the main oil filter housing with bolts, threads lubricated with Engine Oil P03−003, handtight only.

(e) Install the other end of tube (LP01) to the dampener or adapter, threads lubricated with Engine Oil P03−003, to a handtight condition only.

(f) Install bolts, threads lubricated with Engine Oil P03−003, nuts and clamps securing tube to gearbox brackets, handtight only.

(g) Install bolts, threads lubricated with Engine Oil P03−003, on the tube (LP01) which attaches to the diffuser case bracket.

(h) Torque all the clamp bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(i) Torque the bolts that hold the dampener or adapter to top of the main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(j) Torque the bolts securing the tube (LP01) to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(k) Torque the bolts that hold the tube (LP01) to the dampener or adapter to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(l) Torque the bolts securing the tube (LP01) to the diffuser case bracket to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(8) (Post SB PW4ENG 79-75) Install the loop clamp bracket assembly on the fluid pressure dampener or adapter as follows. See Figure 403.

(a) Secure bracket assembly to the dampener or adapter with bolts and nuts to a handtight condition only.

(b) Torque the bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE ETERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(9) (Pre SB PW4ENG 79-75) Install (front) No. 4 bearing scavenge tube assembly (LR05) as follows. See Figure 403.

(a) Remove protective closures and install packing lubricated with Engine Oil P03-001, to groove at flanged end of tube. Lubricate threads on tube coupling with Antiseize Paste P06-054. Wipe off unwanted paste.

(b) Install tube to oil pump port with bolts, threads lubricated with Antiseize Paste P06-054, handtight only. Wipe off unwanted paste.

(c) Install the four (clip-on) loop clamp grommet halves to the main filter oil tube at the two clamp locations (Post SB PW4ENG 79-36 only).

(d) Install the four (clip-on) loop clamp grommet halves to the (LR05) tube at the two clamp locations adjacent to the (LP01) tube grommet halves (Post SB PW4ENG 79-46 only).

(e) Install the two clamps, bolts, lubricated with Engine Oil P03-001, and nuts that attach the tube to the main oil filter tube at the two locations.

(f) Install clamp, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to bracket attached to main oil pump and No. 3 bearing oil scavenge manifold.

(g) Install the two (clip-on) loop clamp grommet halves to the (LR05) tube and two to the (LR04) tube adjacent to the oil pump. Install the clamps, bolts, lubricated with Engine Oil P03-001, and nut (Post SB PW4ENG 79-46 only).

(h) Torque all the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque bolts securing tube to pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(10) (Post SB PW4ENG 79-75) Install (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows. See Figure 403.

(a) Remove protective closures and install packing lubricated with Engine Oil P03-001, to flanged end of tube.

R (b) Lubricate threads on tube nut with Antiseize Paste P06−054, wipe off unwanted paste, and install tube to rear scavenge tube at Flange M and to port on main oil pump with bolts, threads lubricated with Antiseize Paste P06−054, handtight only. Wipe off unwanted paste.

(c) Install the loop clamp bracket on the TCC manifold bridge bracket and secure with the clamp bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(d) Torque bolts securing tube flange to main oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(e) Torque tube nut to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Secure the hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or adapter with clamps and bolts, lubricated with Engine Oil P03−001. Torque the bolts to 27 − 30 lb−in. (3.051 − 3.390 N.m).

(11) (Pre SB PW4ENG 79−76) Install (rear) EEC PT4.95 tube assembly (AS02) as follows. See Figure 404.

CAUTION: DO NOT USED LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(a) Remove protective closures from the tube fittings.

(b) Secure the tube nut to a tee at approximately the 6 o'clock position and rearward of Flange P (Pre SB PW4ENG 72−134).

(c) Secure the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P (Post SB PW4ENG 72−134).

(d) Secure the tube nut to the tube coupling at approximately the 8 o'clock position and rearward of Flange N.

(e) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flanges N and P brackets. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque tube nuts (both ends) to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(12) (Pre SB PW4ENG 79-76) Install (rear) No. 3 bearing oil vent tube assembly (LD02) as follows. See Figure 404.

(a) Remove protective closures and secure tube,
R threads on each end lubricated with Antiseize
R Paste P06-054, to adapter on exhaust case at
approximately 7 o'clock position, and to tube nut
forward of Flange N at approximately 8 o'clock
R position, handtight only. Wipe off unwanted paste

(b) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flanges N and P brackets, handtight only.

(c) Lubricate the threads of the bolt with Engine Oil P03-001. Secure tube to the adjacent PT4.95 tube assembly with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P (Post SB PW4ENG 72-134).

(d) Install clamps, bolt, threads lubricated with Engine Oil P03-001, and nut securing tube to adjacent PT4.95 tube assembly between Flanges N and P. Torque all clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque tube nuts (both ends) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(13) (Post SB PW4ENG 79-76) Install the (rear) EEC PT4.95 tube assembly (AS02) and the (rear) No. 3 bearing oil vent tube assembly (LD02) as follows. See Figure 405.

(a) Attach the (LD02) tube to the (LD01) and the turbine exhaust case, handtight only. See Figure 405 (Sheet 1).

(b) Attach the (AS02) tube to the (AS03) and (AS27) tubes, handtight only. See Figure 405 (Sheet 1).

(c) Install bolt to attach the (AS02) tube to the bracket handtight only. See Figure 405 (Sheet 2), View G.

(d) Install the clamp on the (LD02) tube and the clamp on the (LP48) tube and secure with nut and bolt, handtight only. See Figure 405 (Sheet 2), View L.

(e) Install the clamp on the (AS02) and (LD02) tubes and secure with a bolt, handtight only. See Figure 405 (Sheet 3), View H.

(f) Install clamp on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View I.

(g) Install clamps on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View J.

(h) Install clamp on (AS27) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View K.

(i) Torque the (AS02) tube to the (AS03) tube and the (AS27) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(j) Torque the (LD02) tube to the internal tube and the (LD01) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(k) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) (Pre SB PW4ENG 79−75) Install (rear) No. 4 bearing scavenge tube assembly (LR06) as follows.

(a) Remove protective closures and secure tube, elbow
R and nut threads lubricated with Antiseize Paste
R P06−054, to exhaust case internal tube nut at
approximately 10 o'clock position, and to tube
coupling forward of Flange M at approximately 7
R o'clock position, handtight only. Wipe off
R unwanted paste.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flanges N and P brackets. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque tube nut at exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Torque tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) (Reference 2151) Position spray shield to inboard side of Flange N connection and secure forward end of shield with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(f) Secure clamp to rear end of shield and Flange M bracket with bolt, threads lubricated with Engine Oil P03−001, and nut. Torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(15) (Post SB PW4ENG 79−75 and Pre SB PW4ENG 79−76 only) Install (rear) No. 4 bearing scavenge tube assembly (LR06) as follows. See Figure 404.

(a) Install rear scavenge tube, elbow and nut threads
R lubricated with Antiseize Paste P06−054, to exhaust case internal tube nut at approximately 10 o'clock position, and to the tube (LR05) coupling forward of Flange M at approximately 7 o'clock
R position, handtight only. Wipe off unwanted
R paste.

(b) Install loop clamp bracket on Flange M bracket at approximately 7 o'clock with bolts lubricated with Engine Oil P03−001, handtight only. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Secure tube to loop clamp bracket on Flange M bracket with one clamp and bolt, lubricated with Engine Oil P03−001, handtight only. Torque clamp bolt to 27 − 30 lb−in. (4.067 − 4.519 N.m).

(d) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flanges N and P brackets. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nut at exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Position tube shield to inboard side of Flange M connection and secure forward end of shield with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(16) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows.

(a) Attach the (LR21) tube to the (LR05) tube handtight only. See Figure 405 (Sheet 4), View DE.

(b) Install clamps and secure with nuts and bolts, handtight only. See Figure 405 (Sheet 5), Views O and Q and (Sheet 6), Views F and R.

(c) Attach the (LR22) tube to the (LR21) tube and the port for the internal tube on the turbine exhaust case, handtight only. Lubricate the threads that are on the internal tube with Engine Oil P03−001. See Figure 405 (Sheet 7), Views E and AP.

(d) Install clamps on the (LR22) tube and secure with bolts, handtight only. See Figure 405 (Sheet 8), Views A, B, C and D.

(e) Torque the (LR21) tube to the (LR05) tube to 475 − 525 lb−in. (56.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque the (LR21) tube to the (LR22) tube to 475 - 525 lb-in. (56.668 - 59.317 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Torque the internal tube nut to the (LR22) tube to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(17) (Post SB PW4ENG 79-76) Install the shields for the No. 4 bearing oil scavenge lines as follows.

(a) Install shield at the (LR05) tube to the (LR21) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 4), View DE.

(b) Install shield at the (LR21) tube to the (LR22) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 7), View E.

(c) Torque the clamps to 15 - 18 lb-in. (1.695 - 2.034N.m).

(d) Torque the nut and bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(18) Install No. 4 bearing strainer housing and strainer.

(a) Remove protective closures and install packing, lubricated with Engine Oil P03-001, to groove in strainer. Lubricate threads with Engine Oil P03-001, and install strainer to strainer housing, handtight only.

(b) Install strainer housing, threads lubricated with Engine Oil P03-001, to exhaust case internal tube nut at approximately 10:30 o'clock position, handtight only.

(19) (Pre SB PW4ENG 79-76) Install (rear) No. 4 bearing oil pressure tube assembly (LP16). See Figure 404.

(a) Remove protective closures. Secure tube, threads lubricated with Engine Oil P03-001, at each end, to last chance strainer housing on exhaust case, and to tube nut forward of Flange M at approximately 10 o'clock position, handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03−001, spacer, and nuts to securing tube to brackets at Flanges M, N, and P and to adjacent scavenge tube. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque tube nuts at each end of tube to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) Torque exhaust case internal tube nut to last chance strainer to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque the strainer element to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) (Reference 2151) (Pre SB PW4ENG 79−54) Install spray shields to inboard side of front and rear connections and secure with hose clamps. Torque hose clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(g) (Reference 2151) (Post SB PW4ENG 79−54) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Secure the forward end of the shield to the bracket on the diffuser case with a clamp, bolt lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Secure the rear of the shield with a hose clamp and torque to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(20) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. Also install the No. 4 bearing strainer element as follows.

(a) Attach the coupling nut on the (LP15) tube to the (LP47) tube, handtight only. See Figure 405 (Sheet 9), View LA.

(b) Install clamps and secure with bolts. See Figure 405 (Sheet 9), Views U, T and S.

(c) Install packing, lubricated with Engine Oil P03−001 to the groove in the No. 4 bearing strainer element. See Figure 405 (Sheet 10), View G.

(d) Install the No. 4 bearing strainer element into the No. 4 bearing strainer element housing, handtight only. Lubricate threads with Engine Oil P03−001. See Figure 405 (Sheet 10), View G.

(e) Install the element housing, lubricated with Engine Oil P03−001, on to the tube nut at approximately the 7 o'clock position, handtight only. See Figure 405 (Sheet 10), View G.

(f) Attach the (LP48) tube to the strainer housing and the (LP47) tube, handtight only. See Figure 405 (Sheet 10), Views G and CA.

(g) Install clamps and secure with bolts and nuts as necessary. See Figure 405 (Sheet 11), Views M, N, B1 and P, and (Sheet 12), Views R and F.

(h) Torque the strainer to the strainer housing to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(i) Torque the internal tube nut to the strainer housing to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrul P05−292.

(j) Torque the (LP48) tube to the strainer housing to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(k) Torque the (LP48) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(l) Torque the (LP15) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(m) Torque all the installed clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(21) (Post SB PW4ENG 79−76) Install the shields for the No. 4 bearing oil pressure lines as follows.

(a) Install shield at the (LP47) tube to the (LP15) tube connection. Secure shield with clamps. See Figure 405 (Sheet 9), View LA.

(b) Install shield at the (LP47) tube to the (LP48) tube connection. Secure shield with clamps. See Figure 405 (Sheet 10), View CA.

(c) Install shield at the (LP48) tube to the strainer housing connection. Secure shield with clamps. See Figure 405 (Sheet 10), View G.

(d) Torque all clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−02

Task 72−00−54−420−004:

1. Install External Plumbing After Turbine Exhaust Case Installation

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−059	Wax, Paraffin (PMC 9552)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
R	P05−292	Ferrule, Safety Cable (Optional)
	P06−021	Compound, Antigalling (PWA 550)
R	P06−054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	75−24−00/2/95
Gasket	1	75−26−00/1/190
Gasket	1	75−26−00/1/200
Gasket	2	75−26−00/1/210
Packing	2	79−21−00/7/1
Packing	1	79−21−00/12/190
Packing	1	79−22−00/4/1
Gasket	1	75−24−00/2/90C

B. Procedure
See Figure 401, Figure 402, Figure 403, Figure 404 and Figure 405.

(1) Install the (lower front) turbine case cooling (TCC) HPT manifold assembly (AC25) as follows.

(a) Lift and turn the manifold to engage the manifold (collector) and install a bolt, threads lubricated with Engine Oil P03−001, handtight only.

(b) Install the HPT manifold loop clamp brackets to the forward ward side of the Flange M brackets at approximately the 4, 7 and 9 o'clock positions, angled forward, with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts that attach the manifold to the manifold loop clamp brackets. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the bolt that attaches the manifold to the manifold (collector) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(2) Install the (lower right) turbine blade cooling tube assembly (AP37) as follows.

CAUTION: INSTALL THE LOCK PLATES WITH THE SLOT GROOVE OUTWARD AND PIN (IF EQUIPPED) INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 401.

(a) Remove the protective closures. Install the gasket, with the raised sealing surface visible, to the elbow end of the tube, align the tube slot and four bolt holes. Attach in position with Paraffin Wax P05−059. Install ring gasket to elbow groove with Paraffin Wax P05−059. Install the locks to engage the diffuser case internal tube lip with pin inward (if equipped). Hold the locks in position with Paraffin Wax P05−059.

(b) (Reference 2261) Hold the tube locks outward against the tube lip. Measure and make sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not in this limit, install the locks again and make sure you engage the internal tube lip correctly. See Figure 401.

(c) Install the gasket and metering plate to the turbine vane and blade cooling air valve flanged end of tube. Hold in position with Paraffin Wax P05-059. Install the gasket to the lower flanged port of the turbine vane and blade cooling air valve and hold in position with Paraffin Wax P05-059.

(d) Attach the elbow end of the tube (gaskets in position) and the bracket to the diffuser case pad at approximately the 5 o'clock position with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(e) (Pre SB PW4ENG 72-537 or Post SB PW4ENG 72-627) Attach the opposite end of the tube (gaskets and metering plate in position) to the turbine vane and blade cooling air valve with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(f) (Post SB PW4ENG 72-537 and Pre SB PW4ENG 72-627) Attach the opposite end of the tube (gaskets and ring spacer in position) to the turbine vane and blade cooling air valve with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(g) Install the clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to the diffuser case brackets at three locations. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(h) Torque all the bolts at each end of tube to 85 - 95 lb-in. (9.604 - 10.734 N.m), then torque the bolts again until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts at the diffuser case pad.

(i) Install the clamp, bolt, threads lubricated with Engine Oil P03-001, and nut that attaches the fuel manifold to the bracket installed to the tube flange at the diffuser case. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(3) Install the (lower right) turbine vane cooling air duct (AP02) as follows.

(a) Remove the protective closures.

(b) Attach a new gasket in position to the valve flange at approximately the 3 o'clock position with Paraffin Wax P05−059.

(c) Install a new gasket in position to the pad at approximately the 4 o'clock position on the HPT case with Paraffin Wax P05−059.

(d) Install the duct to the HPT case pad and attach with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(e) Attach the forward end of the duct to the turbine vane and blade cooling air valve with bolts, threads lubricated with Engine Oil P03−001.

(f) Install the clamp over the duct at the Flange M bracket and attach with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque the bolts that attach the duct to the turbine vane and blade cooling air valve to 85 − 95 lb−in. (9.604 − 10.735 N.m), then torque the bolts again until the same torque is kept.

(h) Torque the bolts that attach the duct to the HPT case to 180 − 200 lb−in. (20.337 − 22.597 N.m), then torque the bolts again to the same limit until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(4) Install the LPT case cooling manifold (collector) as follows. See Figure 402.

(a) Remove the protective closures and attach the rear of the manifold (collector) to the Flange P brackets, at approximately the 3 o'clock position, with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(b) Install the front of the manifold (collector) to the Flange N bracket with clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts handtight only.

(c) Install the bolts, threads lubricated with Engine Oil P03−001, and nuts to attach the manifold (collector) to the support bracket and the LPT cooling air valve flange, handtight only.

(d) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the bolts that attach the manifold (collector) to the LPT cooling air valve to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) Install the LPT case cooling manifold (TCC) assemblies (AC01) through (AC14) as follows.

(a) Remove the protective closures and install the upper manifolds over the top of the LPT case and downward to engage the manifold (collector) at approximately the 3 o'clock position.

(b) Install the lower manifolds under the LPT case and upward to engage the manifold (collector) at approximately the 3 o'clock position.

1 Install clamps to the rear mounts of the top half and lower half of the cooling air manifolds. Attach the manifolds to the Flange P brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts tightened by hand.

(c) Install bolts, threads lubricated with Engine Oil P03−001, bracket and nuts to attach the upper and lower manifold support brackets to the Flange N brackets handtight only.

(d) Install bolts, threads lubricated with Engine Oil P03−001, to attach the upper and lower manifolds to the manifold (collector) and torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque all the bolts that attach the manifolds at Flanges N and P to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A

TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(6) (Pre SB PW4ENG 79-75) Install main filter oil tube assembly (LP01) as follows. See Figure 403.

(a) Remove the protective closures and install the packings lubricated with Engine Oil P03-001, to the packing groove at each end of the tube.

(b) Attach the tube to the forward side of the main oil filter housing, with bolts, threads lubricated with Engine Oil P03-001, handtight only.

(c) Attach the tube to the top of the main oil pump with loop clamp bracket angled rearward and bolts,
R threads lubricated with Antiseize Paste P06-054,
R handtight only. Wipe off unwanted paste.

(d) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tube to the gearbox brackets at approximately the 8 o'clock position . Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

NOTE: The bracket at the deoiler outlet port on the rear of the gearbox must be aligned and the clamp bolt and nut left handtight. You must torque the clamp bolt when the deoiler outlet tube is installed.

(e) Install the two (clip-on) loop clamp grommet halves to the tube at the diffuser case bracket clamp location.

(f) Install the clamp that attaches the tube to the diffuser case bracket. Install the bolt, lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque the bolts that attach the tube to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(h) Torque the bolts that attach the tube and bracket to the top of the oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(7) (Post SB PW4ENG 79−75) Install the fluid pressure dampener or install the fluid pressure adapter assembly (Post SB PW4ENG 79−86) and the main oil filter hose and tube assembly (LPO1) as follows. See Figure 403.

(a) Remove the protective closures and install packing lubricated with Engine Oil P03−001, to packing groove on the dampener or adapter.

(b) Install the dampener or adapter to the top of the main oil pump and hold with bolts, threads lubricated with Engine Oil P03−001, to a handtight condition only.

(c) Remove protective closures and install packing lubricated with Engine Oil P03−001, to packing groove at each end of oil tube assembly (LP01).

(d) Install one end of tube (LP01) to the forward side of the main oil filter housing with bolts, threads lubricated with Engine Oil P03−001, handtight only.

(e) Install the other end of tube (LP01) to the dampener or adapter, threads lubricated with Engine Oil P03−001, to a handtight condition only.

(f) Install bolts, threads lubricated with Engine Oil P03−001, nuts and clamps securing tube to gearbox brackets, handtight only.

(g) Install bolts, threads lubricated with Engine Oil P03−001, on the tube (LP01) which attaches to the diffuser case bracket.

(h) Torque all the clamp bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(i) Torque the bolts that hold the dampener or adapter to top of the main oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(j) Torque the bolts securing the tube (LP01) to the main oil filter housing to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(k) Torque the bolts that hold the tube (LP01) to the dampener or adapter to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(l) Torque the bolts securing the tube (LP01) to the diffuser case bracket to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(8) (Post SB PW4ENG 79−75) Install the loop clamp bracket assembly on the fluid pressure dampener or adapter as follows. See Figure 403.

(a) Attach the bracket assembly to the dampener or adapter with bolts and nuts to a handtight condition only.

(b) Torque the bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(9) (Pre SB PW4ENG 79−75) Install the (front) No. 4 bearing scavenge tube assembly (LR05) as follows.

(a) Remove the protective closures and install the packing lubricated with Engine Oil P03-001, to the groove at the flanged end of tube. Lubricate the
R threads on the tube coupling with Antiseize Paste
R P06-054. Wipe off unwanted paste.

(b) Install the tube to the oil pump port with bolts,
R threads lubricated with Antiseize Paste P06-054,
R handtight only. Wipe off unwanted paste.

(c) Install the four (clip-on) loop clamp grommet halves to the main filter oil tube (LP01) at the two clamp locations.

(d) Install the four (clip-on) loop clamp grommet halves to the (LR05) tube at the two clamp locations adjacent to the (LP01) tube grommet halves.

(e) Install the two clamps, bolts, lubricated with Engine Oil P03-001, and nuts that attach the tube to the main oil filter tube at the two locations.

(f) Install the clamp, bolt, threads lubricated with Engine Oil P03-001, and nut to attach the tube to the bracket attached to the main oil pump and the No. 3 bearing oil scavenge manifold.

(g) Install the two (clip-on) loop clamps grommet halves to the (LR05) tube and two to the (LR04) tube adjacent to the oil pump. Install the clamps, bolts, lubricated with Engine Oil P03-001, and nut.

(h) Torque all the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque the bolts that attach the tube to the pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(10) (Post SB PW4ENG 79-75) Install (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows. See Figure 404.

(a) Remove protective closures and install packing lubricated with Engine Oil P03-001, to flanged end of tube.

R R (b) Lubricate threads on tube nut with Antiseize Paste P06-054, wipe off unwanted paste, and install tube to rear scavenge tube at Flange M and to port on main oil pump with bolts, threads lubricated with R R Antiseize Paste P06-054, handtight only. Wipe off unwanted paste.

(c) Install the loop clamp bracket on the TCC manifold bridge bracket and secure with the clamp bolts, lubricated with Engine Oil P03-001, and nuts. Torque the clamp bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(d) Torque bolts securing tube flange to main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Torque tube nut to 475 - 525 lb-in. (53.668 - 59.317 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(f) Attach the hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or adapter with clamps and bolts, lubricated with Engine Oil P03-001. Torque the bolts to 27 - 30 lb-in. (3.051 - 3.390 N.m).

(11) (Pre SB PW4ENG 79-76) Install the (rear) EEC PT4.95 tube assembly (AS02) as follows.

CAUTION: DO NOT APPLY LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(a) Remove protective closures from the tube fittings.

(b) Install the tube nut to the tube coupling at approximately the 7 o'clock position and rearward of Flange P.

(c) Attach the tube nut to the tube coupling at approximately the 8 o'clock position and rearward of Flange N.

(d) Install the clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tube to the Flanges N and P brackets. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the tube nuts (both ends) to 270 - 300 lb-in.(30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(12) (Pre SB PW4ENG 79-76) Install (rear) No. 3 bearing oil vent tube assembly (LD02) as follows.

(a) Remove the protective closures and install the tube, threads on each end lubricated with
R Antiseize Paste P06-054, wipe off unwanted
R paste, to the adapter on the exhaust case at approximately the 7 o'clock position, and to the tube nut forward of Flange N at approximately the 8 o'clock position, handtight only.

(b) Install the clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tube to the Flanges N and P brackets, handtight only.

(c) Lubricate the threads of the bolt with Engine Oil P03-001. Attach the tube to the adjacent PT4.95 tube assembly (AS02) with clamps, bolt, and nut at approximately the 7:30 o'clock position and rearward of Flange P.

(d) Install clamps, bolt, threads lubricated with Engine Oil P03-001, and nut to attach the tube to the adjacent PT4.95 tube assembly (AS02) between Flanges N and P. Torque all the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the tube nuts (both ends) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(13) (Post SB PW4ENG 79-76) Install the (rear) EEC PT4.95 tube assembly (AS02) and the (rear) No. 3 bearing oil vent tube assembly (LD02) as follows. See Figure 405.

(a) Attach the (LD02) tube to the (LD01) and the turbine exhaust case, handtight only. See Figure 405 (Sheet 1).
